of fun to me...I wish him well.

Guess you've never heard of all the freebander clubs, some with hundreds of members worldwide. Their club rosters tend to be quite "open" with regards to members' names and addresses. Aprils, Alpha-Tangos, Charlie-Oscars, Trans-Americas, etc.

That's strange. I thought 90+% of the debate on this newsgroup revolved around the fact that Morse proficiency is still required in order to obtain an amateur radio license with transmitting privileges below 6 meters.

I need help... and I think this is the right place.

Ham radio operator uses abbrevations like A - Alpha, B- Bravo , C-
Charlie etc until Z.
I would be very grateful if anyone out there could kindly furnish me with
the whole list, from A to Z.

Thanks a million.

Cheers!
Thomas Chow from Malaysia

...re: the suggestion to argue via email & not the NG's...

My vote -

Leave the arguement in. Don't take it to email.
I love reading Carl's opinions. He's like a
skin head or a bible fundamentalist preaching
on the street corner. Better than watching the
comedy channel. I can just picture the sweaty,
Jimmy Swaggart like, armpits as he composes
new messages. Perhaps, like the fallen Rev
Swaggart, we'll find Carl in the back room some
day, tapping out cw.

I'd like to hear just what it is that Carl wants
to do on the 'code restricted bands' that he
can't do now because of the big, bad impossible
code.

I'm pro code. I NEVER use code. I'm proud to say
I know code. A lot prouder than I am to say that
I knew the answers to some theory questions about
monostable flip flops. That one just doesn't seem
to attract the girls as much as Morse code.

Don't feel alone, your observation is very much the truth...
Radio in general is stale because of these , pardon my jargon, Old Farts & Know it alls.
When I got into Ham rdaio (bout 6yrs ago) I was an avid electronic enthusiast & wanted more, more, more knowledge... I was also a hacker of the highest degree (still am) & ended up teaching myself most of what I know...
I found it annoying to have to listen to these A**holes chastise other "younger generation" Hams, because we didn't have 9 mile high HF towers or, know code, or say 73's, etc...
Well I eventually got so into radio I ended up a Radio Technician, you would think, every Ham's dream job, right? WRONG. I met the most dispicable people, many of which were Hams, The commercial guys always felt they were above Hams, simply because, they got paid to do it & use commercial equipment.... I was constantly harrased being a ham working in commercial radio, by the older "more experienced" guys, I didn't give a shit, I excelled & eventually started my own shop. Mind you, I was only 25.
I got so fed up though with the assholes in the business, many of which run closed repeaters & the ones whop think they are so much smarter than me & think simply cuz I was 23, 24,25 yrs old, I didn't know a damn about radio, while at the same time I was getting paid to fix their radios & being Emailed up the wazooo to answer tech questions on related topics...
It is PURE arrogance on the part of these guys who think they know everything & feel bestowed to treat other guys like shit cuz they are new to the hobby...
I absolutely am turned off by the 'radio crowd' in my parts (Bay Area , Ca.), bunch of old effer's who have a monopoly on freq pairs cuz they have money & are all part of the same "old boys club"...
Screw those guys, I could of continued to make money doing radio on my own, but why work around assholes I can't stand?
I switched careers & am now a Network Engineer making almost twice the salary, and I'm still only 26... I also run my own Paging & Email service. so I still have ties to the wireless industry both commercially & as a hobby of course.... I have a truck fully decked out for communications, with all the top gear, but that doesn't make a better ham than anyone else though, what does make me way better than these old assholes, is I won't chew your ass if you ask a "dumb" newbie question, or debate it, nor will I run you off a repeater, because it's "Private".... I am willing to spread the knowledge & help other guys who don't know what I know, believe me I learned a lot of secrets working in the business & never hesitate to share them..
Face it Old Timers, the days of the secret handshake are over....
Who gives a damn if we dont't know about about tubes, crystals & code....
You can't hold back NEWER Technology or the knowledge thereof...
It's alright dano, I'm on your side.

From: jhine41015@aol.com
Message-ID: <19980111131601.IAA24793@ladder01.news.aol.com>
Source record: 181841

I have the opportunity to purchase a split site repeater system which includes
the following...
GE MVP
Package consists of two separate units.
VHF Receive & Transmit units link via UHF.
VHF Tx 25+ watts - UHF Tx 20+ watts
VHF uplink & downlink transceivers
Crystal elements
Microphone & Speaker
Both units have PL tone boards
Full printed documentation of conversion

...well? Is this a good buy for $200?

thanks for your suggestions, comments, and opinions.

Michell!
It may look like you are posting a reply to me.....
My intention was just to reply to another post.
Personally, I like CW operation, and I operate several contests using cw mode on HF and VHF every year. CW activity seems to have increased in this part of the world during the 32 years I have been licensed, the CW sections of HF as well as VHF/UHF bands are often rather crowded.
Some friends like to operate cw because QSO's are simple, you don't have to make long talks when you have nothing to say, this in contrast to the rather boring QSO's heard on repeaters, so I decided only to operate cw/ssb except from fm packet radio (no speaker on my 2m FM rig).
We often find the American/ARRL policy to threaten amateur radio elsewhere, and it was not too many years ago you wanted to remove the 10m beacon band. There are several important beacons meaning a lot for amateurs around the world, but packet radio seems more imprtant to ARRL?
I sometimes wonder who is ARRL, we see a lot of directors and subdirectors, what sort of amateur radio organizations it this?
In most parts of the world amateur radio organizations seems to operate from very much people who work for something they believe in, not to make money.

> there.

No, I haven't Richard. I don't need surveys to see the slow trend away from Morse and towards other operating modes (in the other radio bands, and in the Amateur bands).

And, like I said before, I don't doubt that CW will be around in the Amateur bands for many years to come (as it should). I'm certainly not trying to kill code, only the code requirement for the license test.

> You'll find several times more CW stations than packet, ...

If you add the VHF/UHF bands (also Amateur bands), the digital modes are quickly catching up to CW in popularity (if digital has not already caught up).

When you add the non-Amateur bands, CW is quickly left in the dust. We cannot ignore what is happening in the other radio bands when talking about Amateur radio. What happens in those bands will almost certainly eventually affect the Amateur bands also.

> ... and if you had ever operated HF packet you would know that it
> is not dependable because of lack of noise immunity.

The military routinely uses digital modes in the HF bands - with complete reliability. The digital modes used in the Amateur bands will eventually advance to that level also (or will be replaced with more reliable digital modes).

REPLY...

I said that digital modes are the future, and used packet as one example.

I don't doubt that CW will be around for a long time to come (indeed, I have said so in other messages). But, as digital modes become more advanced, and more reliable, they will play even a greater role in the future (perhaps even greater than CW one day).

REPLY...

I was not aware that any of us were arguing, Cecil. People can have different opinions, and discuss those different opinions, without arguing.

And I don't think anybody was arguing that one mode, or another, is best - only that a certain mode is more popular in certain situations.

And nobody is trying to force anybody to do anything. We were discussing the morse code test requirement and got off on this side topic along the way.

Perhaps you are reading too much in the messages posted - I don't think anybody is losing sleep over this discussion.

REPLY...

Welcome to the debate, Michelle. I won't comment heavily on what you said, because I agree with almost everything. I just wanted you to know you are welcome, and look forward to your comments in the future.

Having said all that, I will disagree with one aspect of your message - your rather pessimistic view of the hobby. I think Amateur radio can be healthy again.

The use of radio is growing strongly in America. This is certain to attract new people to Amateur radio. But, whether they see it as a way to learn an interesting technology, or a way to increase possible job opportunities (learning radio skills), people today are more interested in the technical aspects of radio, rather than more "archaic" aspects like Morse code (simply because they don't see it used elsewhere).

The technician license has attracted a lot of new people to Amateur radio (it is the fastest growing license class). If the code requirement was also dropped from some of the other license classes, I think Amateur radio would see a resurgence like it has not seen in a great many years. I even think that the number of people using code would eventually increase (more people, more possible code users).

So, I have a little more optimistic view of the future of Amateur radio (perhaps because I want to see it continue so badly). Like you, I think dropping the code test requirement is one way to insure that.

Glen Quarnstrom <address@sig> wrote:

>For that matter, I will bet you a weeks pay that even on 2 meters, the
>total ham allocation is busy less than 20 percent of the total time in
>any given week, in your area.

Well, let's see....

Since the average person works days, it is extremely likely that s/he will not be on the radio between 8am-5pm. Its also unlikely s/he will be on the radio from 11pm-7am, when most people are sleeping.

So, other than a small sliver of time early in the morning during the commute, and the afternoon commute, and "after dinner" hours, there isn't much time for people to operate during the week. Of the remaining 8 hours in the day less work/sleep, one would have to be on 4 hours/day to meet the 20% estimate you put forth.

>Where is it written that every ham has to have an FM repeater on two
>meters, anyway? Why aren't hams pioneering trunking, or other
>techniques to expedite usage of the crowded two meter band there?

No commercial gear, and nobody knows how to build it anymore. What good is a repeater that, even if people did have the technical knowledge to build it, would effectively be used by nobody?

We are having some crisis in Montreal area (Please visit
http://cnn.com for more information), but CW and HF are rarely used
for emergency purposes.
Moreover, the ones who are handling emergency stuffs are those active
on 2m repeaters... not on HFs.
I see no CWer(pro-coder) who is active to help others out on 2m freqs.
too bad. well, they have no VHF rigs anyway. they can't do anything
about it. yeah, you are right.
CW and CWers are good for emergency communication, eh ????? think
about it again.

that's why CW is useless. (?)
I have the internet access in my place and I don't have any problems
with connecting it at this moment.

anyhow, no one is using CW to pass the information out for emergency
purposes at this time... in my area. So please don't talk bout CW
for emergency purposes anymore. This crisis proved that CW would not
be a good mode nor way in emergency situation. Moreover, Pro-CWers
on HF aren't active for helping the people out. Well, they don't
have VHF rigs (which are mainly used for emergency purposes) so they
can't do anything about it.

1154. Shortwave Question

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-11 00:00:00 UTC
From: Chris Liptak <liptak@widomaker.com>
Message-ID: <34B8E4C3.20B1CBC3@widomaker.com>
Source record: 181854
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I've got a question about shortwave bands. I am going to be moving to Rome, Italy next year and wanted to take along a shortwave radio so I could catch the English language BBC and U.S. NPR shortwave broadcasts. Problem is, I don't know what bands they broadcast in. Can anyone tell me what I should be looking for?

I'll also take recommendations on equipment.

Here's what I've pulled up so far on some Grundigs --

Grundig 960 - Covers AM, FM and SW from 3.2 - 21.75 MHz
Traveler II - Covers AM, FM and SW from 2.3-7.4 and 9.4-26.1 MHz
Yatch Boy - Receives shortwave frequencies from 2.30-7.4 MHz and 9.4-26.1 MHz

Thanks.

Chris Liptak

>Just an observation.

In the same vein, I wouldn't want to admit using non-type accepted equipment on commercial frequencies... This is why the FCC is currently considering requiring amateur equipment to be restricted to amateur bands only.

1156. Help! TS-820/VFO-820

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-11 00:00:00 UTC
From: luecknik@world-net.net
Message-ID: <34b8d1f8.8919886@news.world-net.net>
Source record: 181856

Just bought this unit at the San Antonio Ham-Fest yesterday, and I
can't get the remote VFO to function properly.
With a shorting plug in the TS-820, and the Function switch on VFO,
everything works good. The VFO LED lights, the digital display lights,
and rig receives good.
Removed the plug and installed the VFO cable and unit. The VFO and
TS-820 light up - - - but that is it. Just background noise. I put
the TS-820 Function switch on VFO.R, and the VFO Function on REC. No
LEDs lit, no digital display, no action at all. Just 2 units lit up. .
Am I missing a strap, or procedure?. Thanks for listening. James

1. 750TL (TH?) transmitting tube. BIG hugger in suspension/shipping jig
2. Crystals: scanner, FT243 (this the number?), VHF Eng tx xtals, calibrator xtals (1 Mhz, 10 Mhz, etc) Need a crystal --- let me know. I'll dig thru 'em.
3. Coil stock: was packed away for thirty years! AirDux and B & W: mostly smaller coil stock, let me know your needs: mfgr part number preferably or diameter, tpi, length.
4. J-45 Leg key --- Used this "clip-on" telegraph key to run HF mobile CW years ago.... yup, MOBILE CW. Is it worth anything to one of you out there?
5. AA battery magazine for GE "PE" portable - - - new, never used. (Fill w/AA's for emerg use)
6. Kantronics unit with software. email if interested
7. Some older books: ARRL, Bill Orr, etc
8. "Perpetual Troubleshooter's Manual" by John Rider, volume XIV, copyright 1944, from Int'l Correspondence Schools Schematics and alignment procedures for:
Air King, Allied, Belmont, Crosley, Detrola, Echophone, Emerson, Espey, Farnsworth, more!
Three-inch-thick binder filled with 50+ year old information! Best offer over $150.

email to < blueis@sprintmail.com > if you see something on this list that interests you.

>bands, and in the Amateur bands).

This sounds like one of those "FACTS?!?! I DON'T NEED NO STINKIN' FACTS!"
comments.

With alternate modes popping up right and left, the percentage of CW
use is down, but I believe that more people are using CW today than ever
before. For instance, recently an ARRL survey claimed that 27% of licensed
amateurs use CW on a regular basis.

> And, like I said before, I don't doubt that CW will be around in the
>Amateur bands for many years to come (as it should). I'm certainly not
>trying to kill code, only the code requirement for the license test.

You might not be, but other people here are.

> If you add the VHF/UHF bands (also Amateur bands), the digital modes
>are quickly catching up to CW in popularity (if digital has not already
>caught up).

There is no reason to add the VHF bands, CW operation is very rare there

> When you add the non-Amateur bands, CW is quickly left in the dust.

Why would we add the non-amateur bands. We're talking about AMATEUR radio.
What taxi-drivers in NYC use to get dispatch calls is irrelevant. Other
services have different charters.

>We cannot ignore what is happening in the other radio bands when talking
>about Amateur radio. What happens in those bands will almost certainly
>eventually affect the Amateur bands also.

About the only effects "happenings" in other bands will have on amateur
radio are 1) we may see some technology adapted into ham equipment, and
2) growth of alternative services will place a demand on our frequencies.

> The military routinely uses digital modes in the HF bands - with
>complete reliability.

Could be, but I doubt a "miltary TNC" costs $300.

You may be receiving the cordless phone as a mixing product of other
radio equipent in use slose by, either your own or that of neighbors.

Several years ago I once got a phone call telling me that I was
transmitting on a 170? mhz forestry frequency (I don't remember the
exact frequencies) while I was working 2meter FM. Monitoring that
frequency at my QTH revealed no hint of RF being radiated on that
frequency. The caller was a very experienced radio technician
(non-ham), and while talking to him about the source, I learned that he
was running 2 scanners in his house at the same time, and and could hear
me on the 170? mhz freq on either scanner. Spending a few minutes with a
calculator, I found that his scanner IF frequenies were mixing with my 2
meter freq and producing the signal he was hearing on 170? mHz. I
called him back and asked him to turn off one scanner and listen again,
and when he did *nothing* was heard of my signal on 174 mHz.
These things do happen. Try turning off any radio/tv/electronic
eqiupment under your control, while the cordless phone is working to see
if the cordless signal disappears.
I wouldn't complain to the neighbor under any circumstance, he/she
would not understand and you would likely be suspected of deliberatley
monitoring their phone calls.
If nothing else works, you will have to lock out the offending channel
on your scanner.

Chris any of these will work just fine, all you need to do is do a web search for shortwave, there are hundreds of web sites that have current program shedules etc.

>in her ball court.

FWIW the RF oscillators in these devices tend to work on harmonics - eg my 49 Mhz RS baby monitor uses a crystal for roughly 14 Mhz driving the RF amp on the 3rd harmonic. The cheap bandpass filters on the phone might not suppress all the unwanted emissions.

Somewhere on the botttom of her device will be a sticker stating the FCC type approval for the equipment, which probably reads "the use of this device must not create interference for anyone else" or words to that effect - so it truly is her problem. I bet if you tell her you can hear her, she'll buy a new phone quick :)

If the neighbor gets too nasty, I would complain to Industrie Canada that her consumer equipment is interfering with licensed amateur radio operators. I don't know if I.C. would respond in any similar fashion to the FCC, but it might help. Also, CRRL should be able to provide you with material on dealing with RFI.

National bandplans are just gentlemen's agreements (that are like the computer licenses) ... we the users don't have anything to say about them ... just the ARRL which thank god does NOT have any legal authority in the matter. It (ARRL) is a private corporation not a governmental body.

Great. That settles the issue. Why didn't you RADIO COPS just tell him that
in the first place, rather than carry on like a bunch of playground
tattle-tales about how TERRIBLE it would be to even THINK of running this radio
on 27Mhz?

You would have made a good little German in
>1940.

Question for Tommy: how does this (as you have claimed) show that I either currently live in Kansas and/or have previously lived in Florida?

Note for those who are having a tough time following the quotations: "CB RAMBO" is quoted as sending the lines prefaced by "-". The other party sent the ">" lines. Thus, "CB RAMBO" did NOT send the "I live in Wichita" line.

What's your answer, Tommy?

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

Yes my call is a vanity callsign, what is your point? Most of the members of one of my ham clubs now have vanity callsigns.

You might be confusing 'bandplans' by the ARRL (non binding/no legal status) with Part 97 (law) which are. I just used 50.125 mhz for 6m SSB when I was a Technician and on 6m, never heard any 6m FM stations here in Atlanta.

If you retest the hams at 13 and 20 wpm you would probably eliminate
about 75% of all hams General class and higher. Is that what you
really want to do? If code speed is important to get the license then
it would have to be on any re-test to renew that same license!!

This software is used to
provide the user with information related to Global Maritime
Distress and Safety System;
help him acquire skills of usage of radio communications equipment
used within GMDSS.
All data provided by the software fall into the following categories :

text;
pictures;
short video films;
short audio pieces (both speech and music);
binary databases (tables);
executables each simulating a certain radio equipment.
All these pieces of data are cross-referenced in a multiway
chierarchial-tree global structure. In effect, they form a hypertext
system, one of its well-known advantage
being the ability of the user move within a "layer" of data
corresponding to his current level of proficiency; but if necessary, he
may "descend" to the very basics of any
issue, e.g. to a physical definition of oscillations.
All the above components of the database are easily added and
modified; it does not require recompiling of the software (except
executables).
The total size of the database is limited only by free disk space.
The program is installed on a local area network, each station
representing a ship, coast radio or shore-based subscriber station and
it can work as a standalone
workstation.
The program simulates work of radio communications equipment,
including sending/receiving messages and voice to/from ships. The voice
communications are implemented with a Sound Blaster audio card installed
on each computer.
Three different types of workstations are available : shipborne, coast
radio and subscriber stations. The latter two simulate an exit to
shore-based communication networks.
In a sense, this program is self-documented and almost all data
presented in this manual is easily reached right from the program.
The program is released in two versions : full version for local area
networks (LAN version) and standalone version for onboard training.

> expected to do. That's what professionals do and get paid for.

All true (except the power trip comment), and it's also true that code is a commercial mode that surely won't be around long, by all accounts-the 500kc system at the time of the SOS was in it's last day of operation in England! So the "Professionals were doing what they do every day and get paid for" for the last time on the very last day of Code's maritime existance in that part of the world!!!
Is this ironic or what??

What if another similar ship sank in the same area the next day??

With the requirement gone, all the equipment and its officially sanctioned/required operators will soon be gone, also. So let's just let it die, and any further usage--I mean REAL usage--beyond recreation, can be ignored, since after all those high reliability(!) GMDSS units will handle all emergencies at sea, right?
(Of course a great many ships won't have them anyway, but hey, why worry about those folks? If they just would browbeat the ships owners to spring for the costs they wouldn't be putting themselve in harm's way, right?) Is this all a big money thing, fostered by high-tech proponents (with no financial interests, of course)or what? Changing the technology at a reasonable rate, along with an orderly system of equipping all ships with the new technology *BEFORE* abandoning the old would make some sense--Nah, too rational. Instead, let's just turn off the CW circuits and let them fend for themselves.

I believe that a great many shipboard RO's who are also hams, will be carrying their personal ham radio equipment-including CW capability-along just in case. THEY know the story beyond the published theory of how well the new stuff does/doesn't perform and it's *TRUE* reliability. They also know that interested hams hold daily maritime mobile nets, on SSB, that monitor frequencies to assist them in any need. They also know that if conditions are poor enough that SSB can't be used on those

frequencies, (shipboard antenna systems can be somewhat marginal, contributing to poor operating conditions, you know) those nets are manned by *CODE TESTED* hams who will be able to communicate with them on CW if needed. Some even have high tech digital modes to use, if they find them usable.

So Cecil, go ahead and immerse yourself in the technical theories of leading edge laboratories, along with Dr. Williamson and others, and forget about CW, as the good doctor apparently has done. Code is of no further value to you other than for your occasional amusement. Conditions out in the real world, particularily on the high seas and the third world, however don't conform to your narrow view of life. It's a cetainty that your theories on the subject WON'T prevail there among the common people who live these stories.

> I am alive today because I was NOT wearing a seat belt in a 1961 wreck.

And I'm alive today because I *Was* wearing a seatbelt in a 1960 accident--long before they were installed in cars.

> Is that a good reason not to wear seat belts? If not, why is an isolated
> commercial incident, in which amateurs were not involved at all, reason
> to force hundreds of thousands of amateurs to learn Morse code? Where is
> the Return On Investment, Dick? (Your warm, fuzzy feeling is not a good
> enough return.)

You seem to have no sense of the true mission and universal communications concepts so deeply ingrained and innate to Ham Radio and it's charter. Today, it seems that the "I wanna" or "I don't wanna" philosophy has totally abandoned any sense of responsibility for any reason unrelated to self gratification, I see that as the core basis for the No-Code Agenda. It used to be "Me first". Now it's just "ME".

Tell you what Cecil--your reasons for "warm fuzzy" feeling will comfort no one except yourself and your fellow no-coders. I doubt that any sailor who needs help will care about the source of the help, and your "warm, fuzzies" won't help at all. If he can reach a ham when in need of help, history has shown that he will gladly do so.

For Local, i.e. short range communications, VHF and UHF reign supreme!
However, if the disaster were on a Caribbean Island or other remote
area, the long distance capability of HF would be used for emergency
communications. In the event of poor atmospheric conditions to boot, CW
could be used for clearer communications.

Imagine a hurricane which has caused a lot of damage and destroyed many
buildings and antennas. A battery or generator operated HF radio with a
simple "wire" antenna could be used to communicate with the mainland for
disaster aid.

Under these conditions VHF and UHF are useless. They are superb for short range, but now amount of added power can realistically make them long range radios (under normal circumstances).

>50.0 Mhz would be fine as a calling frequency for CW, since CW has zero
>bandwidth and your signal would not go below 50 Mhz.

Ok, guys, lets not confuse the theoretical world with the real one! "Your transmitter keying envelope rise and fall times determine both the bandwidth of your cw signal and the maximum speed at which you can send and still be received properly. Once set, the rise and fall times(not keying speed) determine the band width.....If the rise and fall times are 2ms (fairly typical of commercial transceivers) , the band width would be 375 Hz." From the "Guide to the FCC Regulations", ARRL, 1993. What this means, then, is that with a typical xcvr operating in cw mode, you are not safe any closer to the band edge than 162.5 Hz. And this does not factor in your frequency display margin of error! For that, consult the manual that accompanied the rig.

As for safety margin on ssb, the problem goes beyond just the margin of error in your display. Most folks consider ssb to be about 3 kHz wide. But depending on your filter, at 3 kHz you are probably only 6 dB down, and the FCC wants you to be 40dB down. You'll need to consult the chart that accompanied the filter to find out where the 40dB point is. And also consider that few, if any, filters are of "brick wall" integrity! So to operate at, say, 7.299 mHz, and assume that because you are on lsb that you will have no products of modulation occuring above that frequency, is to invite an OO notice(the FCC having closed its monitoring stations and abandoned the inforcement role).

Seconded! I would support a retest at each renewal. Would you suggest that the test include all elements up to the class granted, or just be the question pool for the class being renewed?

You have all the tools you need right in front of you. Check the SWR at 3505 or so. Then go to 3700 or so. If the SWR is higher, then the antenna is too long. If that doesn't work out, then go to 3995 or so and check. Get the SWR there and then go down to 3900 or so. If the SWR is higher going down in frequency, then the antenna is too short. Assuming you are talking about the 75 meter band of course. Good luck es 73 W7AX

Renewing doesn't cost anything other than the time to fill out a one page form and a stamp. So, you're not into ham radio right now, you might get into it again in a few years, and you'll have the license all ready to go.

Upgrading may be a different issue, especially if you live in an apartment with antenna restrictions. Which makes HF ackward. VHF not so bad, the antennas are small.

Hello,
I have noticed that I have a S5 noise on 3 to 5 Megahertz on my PCR 1000. I think it is comming from my computer as I have tried it from two different homes with the same computer. I have turned my monitor off and it makes no differance. I cant turn my computer off as I loose the ability to operate my radio. I have no other shortwave recievers.
Please let me know if anyone else has noticed it and if there is a solution?...I have even tried a real long (25 feet) serial cable and that did not help either.

Ever heard of 222? 902? 1296?

For that matter, I will bet you a weeks pay that even on 2 meters, the total ham allocation is busy less than 20 percent of the total time in any given week, in your area.

Where is it written that every ham has to have an FM repeater on two meters, anyway? Why aren't hams pioneering trunking, or other techniques to expedite usage of the crowded two meter band there?

And the thing which pisses you off, is that you can only hear one
side of the conversation. ;-)

147.06 / 3 = 49.02

49.02 is the handset frequency of a cordless telephone pair.

Looks like a harmonic rather than an IF image, which puts the problem
in her ball court.

>Should I complain about this to my neighbour ? Should she stop
>using it ?

You can request your neighbor to avoid that channel... since she
obviously has one of the 25 channel phones which can change channels.

Don,

That's a price you pay for living in a population center. You'll
always have that situation in major metro areas. In the other 99%
of the country there is no problem of congestion. I'll also
hazard the idea that there are certain times of every day and
days of the week when even your local area is pretty quiet.

Huh? You know, sometimes Bill I honestly can't fathom how you manage to
come up with some of the "implications" you think are behind every posting.
Where does this "too many hams" idea come from?

Most people are otherwise occupied 17 out of 24 hours per day with other
activities. For the bands to be 20% occupied, that would imply
continuous use for 5 hours each day. Given that most people don't live,
eat, and sleep ham radio, their remaining 7 hours/day for leisure time is
spent in a variety of ways.

My point was, quite simply, that unless you happen to live in a large
metropolitan area it is unlikely your local bands would appear busy 20%
of the time. Its more likely you will see some periods of congestion,
and then large periods of inactivity.

Yep, that was my first receiver too, a BC-45x and with an IF of 1+ MHz, it received ALL of the CW signals in the 40m novice band all at the same time. Not liking the results, I mixed the 1+ MHz IF signal down to 455kHz and ran the resulting signal into the BC-45x that covered 400-500kHz and had an IF of 50kHz. Now that was a sweet CW rig, close to single-signal reception and rivaling the performance of a Collins receiver after I installed a Q-multiplier.

I think it was QST that had an article about it. Even back then, some of us preferred to work smarter, not harder. :-)

Walt,

This is absolute rubbish. It has no basis in fact at all and
you should know that. IF CW acted as such a filter then
we'd expect to find the riff raff of CB types (not a description
I agree with by the way) on VHF and the simple fact is
that we find no more or less bad apples on VHF (the nocode
techs) then we do on HF where code is required.

There has been absolutely no statistical support for any
assertion that code filters out while the theory test
doesn't.

OK, so we agree. The bottom lne is that band congestion because
someone lives in a metro area and can only operate during the typical
peak hours is no reason to view the number of hams as being too
many. My aplogies if we were apparently in agreement.

Expand the test pools for general, advanced and extra
as has already been done for novice and tech. No code
test at all (5 wpm until the ITU treaty requirement ends).

The subject matter covered by the theory tests is expansive
enough, the expansion of question pools will minimize pure
memorization.

This is not new. It is what many of us have asked for
for some time now. Heck, keep the code test if you want...
IF and only IF, you integrate scoring of CW into the overall
test score instead of having it as a separate test
element.

Then MAYBE we ought to put this policy into effect for everyone
concerning their drivers licenses as well. As of now, only NEW drivers
must test, or to upgrade a license to CDL or something. OR if caught DUI
or some other offense. Otherweise NO ONE gets retested. And, traffic laws
do change sometimes. A lot of states that never had RIGHT ON RED (where
posted or not restricted), now have it. Those drivers prior to those laws,
simply had to learn to adjust. Of course, some think now, you can do it
anytime anywhere. So, perhaps we whould all retest for this too!!!!!

I don't think so.......

I think this is getting a bit carried away.

>hobby.

Note that "cutie boy" has passed the Canadian solid copy requirement
at 5 WPM, which tends to dilute your position.

Even a flatworm can be conditioned to run mazes. It takes no intelligence
to copy Morse, just Pavlovian conditioning to respond to tone sequences.
In fact, if you try to think, you screw up. So if Morse selects according to
intellect, then it would tend to select disproportionately those of low intellect.
If that is the sort of unthinking quality you want in amateurs, then Morse may
be the filter for you. If we have any hams with high intellectual capacity, it is
despite the Morse tests and not because of them.

The reason CB is the way it is has nothing to do with a lack of Morse tests.
It is the way it is because CBers can hide behind anonymous "handles"
like figures in a masked mob. They can do any anti-social thing that they
like without much fear of consequences to their reputations in the real
world. OTOH, amateurs have traditionally proclaimed their "true names",
IE their call signs, loudly and frequently, and demand that others they
contact do the same. They exchange their home addresses for the
purpose of exchanging postal cards. This strongly affects behavior by
stripping away the security of anonymity. It isn't a 100% control on
behavior, but it is the major self-policing factor among amateurs.

The fact that the FCC has stopped enforcement against those who can't
or won't police themselves, first among CBers and now among hams,
hasn't helped matters, of course. But Morse tests have nothing to do with
behavior, good or bad. They just demonstrate that one is susceptable to
Pavlovian conditioning, like the dog which becomes conditioned to salivate
when the dinner bell is rung. If a dog can be conditioned do that, any "riff-raff"

CBer can be conditioned to receive Morse. But just as the dog remains a dog,
so too do the "riff-raff" remain "riff-raff" whether they beep or not.

Boy Howdy! Do I remember those stories. They were great. They mixed
adventure with a bit of technical knowledge in a really slick way. I always
wanted to go out and build something after reading one. In fact, I did
build the proton resonance magnetometer the boys built in one of the
stories. Even got it to work. I sure would like to see these stories reprinted
in book form.

>cellphones, everyone has that ability! Sorry, but ham radio has lost
>its charm for me!

It hasn't lost its charm for me. I still get a kick out of building things that
communicate in new and interesting ways. The things have become more
sophisticated over the years, of course, and a lot of them now include
firmware as well as hardware. I suppose the difference is that operating
doesn't hold much attraction for me once I prove to myself that what I've
built works as expected. Then it is on to the next project. That keeps
amateur radio fresh and interesting to me.

When I just want to yack about some new idea or harebrained scheme
with like minded people, I reach for a Japanese appliance. And it doesn't
much matter to me if that appliance requires an amateur license to operate
or not, or whether it is wired or wireless. The only advantage of amateur radio
for that usage is that it is more likely I will run into someone of like mind when
using the amateur radio appliance than when using the cellular phone
appliance. The method doesn't much matter, it's what we talk about that
matters.

>nowdays do we ??

We don't *have* to, but the minimum power necessary rule says that
we should strive to work with the weakest possible signals. And digital
modulations such as BPSK, QPSK, and other M-ary modulations let us
do that better than any other method. And strong uniform codes using
FEC also allow us to do that better than irregular codes with no FEC
like Morse. If this weren't so, then those weakest of all signals coming
from beyond the edge of the solar system sent by Voyager and Pioneer
would be in OOK Morse and NASA would have headphone wearing
operators copying them. But of course they don't. And that's because
those headphone wearing operators couldn't even hear the signals in
the noise, but machine methods can.

Finally! one of the procoders had the guts to say and prove that the CW requirements have nothing to do with CW being anything more than a a ritual rite of passage, designed to keep the wrong people off the HF bands. When you strip away all the myth around CW your left with one simple fact: CW is nothing more than a filter to restrict access to the HF Bands. Any other reason is a fallacy and is being used by pro code advocates for misdirection.

If so obvious and reasonable why aren't other groups routinely and
regularly retested? Because of the knowledge that after learning comes
practice and they complement each other. Possibly the most serious and
telling example is medicine where life is at stake. If doctors can continue
to mix early education with continuing practice (at varying levels and
specialties) then why burden the amateur community with required retests.

Most of the "fun" in using simplex on two meters is seeing just how far you can talk. Its a lot more fun to make contact with someone who is on the other side of town (10-15 miles) than use the all reaching repeater that is sitting on top of a 9000 foot mountain and can get a full quiet signal from anything within 200 miles. It is also good preparation for possible emergencies where you may need to have an idea of where good radio locations would be for setting up vhf relay or control points.

I disagree. CW is sort of like riding a bike. Once you learn it you have it with you the rest of your life. You may be rusty and have to bone up a little to get your speed up but you don't have to go through the whole learning process again.

Do you have anything to reference to that? From my experience it sure seems like a lot of the repeaters in the area are starting to sound a lot like the crap on 11 meters. Even to the point of the 10-4 good buddy type conversations. I don't seem to find nearly as much on HF phone and have never really noticed it on CW.

And as a filter it doesn't result in any more elimination of bad
apples than the theory test does. Any test will keep out
some people and the if bad apples only stay away because
of code, then why doesn't VHF exhibit a proliferation of
bad apple behavior any more than HF does?

I agree. Add to that the use of a typical 50 watt mobile and you
can get pretty impressive results. But even if limited to a 10 minute
QSO, whats wrong with that? Many QSOs are a lot shorter than
that.

It is ironic a ham would say we have a distance capability that is
barely better than a typical CB channel 19 contact. I've had
short CB contacts with other drivers going in the other direction
when we travel with our antique car club. As above, just because
you can't stay in contact longer than 10 minutes (I think in
many cases it'd be longer) doesn't mean we should avoid
mobile simplex opportunities.

Yes, down from 100% in 1917 +/- 3 years. If it continues at this rate of
decline, the percent of amateur CW use would linearly extrapolate to zero
sometime between the years 2025 and 2028.

OOOPS! I miscalculated. The trend shows an expiration of CW use between
2010 and 2013. A 73% drop over the period. Bill Pasternack would have us
believe the International requirement will come up for review 27 to 30
years after no one uses it anymore.

I disagree. H&W traffic, as of late, has been more effectively handled
by Internet traffic. Since the is usually *some* degree of a communications
infrastructure in a disaster, H&W traffic is still passed over VHF to
parties on the rim of the disaster, who in turn pass the traffic over still
operational phone circuits onto the Internet.

>I live in Southern California and all of our

Well, I think VHF does to some extent. My issue is more than just keeping out 'bad apples' I'll talk to ANYONE on the air but I hear so many no code techs who don't seem to really have interest in radio. I seriously don't know why they botherd to get licensed. They are very content to have a 2m ht and work the repeaters with little to no interest in what makes it all work. I wish I had a nickel for each time I've heard someone say "hey Tim I'm just an appliance operator, I admit it." Makes me ill. While CW is no 'cure all' at least those who started as Novices and learned how to cut a dipole, listen through the noise, actually hear what changes in propagtion sound like, at least those ended up with a good foundation of radio basics. By gosh you had to WORK to get that first QSO, not just key a mic and say "N8_ _ _ monitoring" When I finally got to 2m I new something about radio.

I'm thankful I started out that way, I can see how I may have completly missed it all if I jumped right into 2m. And now we want to give HF phone priviliges to the same group of guys I hear on 2m who aren't really interested in radio. Well perhaps it will come to that someday. I joined because I had an interest in shortwave radio, communications, electronics and I was willing to pay the price, which at the time was learning morse. If it mean becoming proficient in another language I would have done that too! If you want it, pay the price. Rite of passage? Old farts club, secret handshake society, I don't care what you call it. I'm going to continue to support it for HF priveleges.

Wayne Green argued for years about all the wonderful RF Engineers, Microwave Specialists, etc who would bring a wealth of knowlege to our hobby but wouldn't join because of the code. Well, where the hell are they 10 years later? Didn't seem to do much for VHF and above, based on past performance I can't see how it's going to help HF either. So let's drop the 'bad apple' filter thread and talk about amateurs who are willing to go the extra mile to get there.

My 6 1/2 cents worth

Tim, ka8ddz

1241. unmodulated carriers (was: Re: Hams on 2m 147.52)

>Well, ok but I don't understand the difference between OOK morse and an
>'unmodulated carrier' I assumed they were the same.

Without getting too technical, simply consider that moving information (ANY
sort of data rate, INCLUDING MORSE CODE) does not come for free.
You must pay some sort of bandwidth penalty as far as side bands.

If this were NOT the case, we'd see computer driven Morse code
operating at many megabits per second and occupying no more
bandwidth than that of a continuous carrier. And we'd see
commercial interests doing wireless video conferencing on HF
via high speed computer-driven OOK. ;-) But in fact we do NOT
see this.

OOK modulation is terrible for data rates other than those capable via
human readable means. Thus we see techniques such as AMTOR
and GTOR used for HF data transfer rather than computer driven OOK.

So once we understand that a greater data rate USUALLY means
a greater bandwidth penalty, we must make decisions as to which
band we will use, the forms of modulation, and what hardware
infrastructures are best given the data rate requirements of the
application. We must also consider the application's need for
distance (station to station DX may NOT be needed) and reliability
(ionospheric problems may be unacceptable).

In summary, the bandwidth "efficiency" of long haul Morse DX is a viable
option IF you don't have a whole lot to say in a very short time and you
are
willing to live with the vagaries of the ionosphere.

Once you finally realize that Morse Code is just ONE of MANY choices
in our "toolbox of communications solutions", one is left with this amusing
anomaly...

Morse Code has the dubious distinction of being worth the MOST
"points per contact" in a bizarre and twisted form of "entertainment"
known as ARRL "contesting".

And that alone should make you want to master it. ;->

OK all you No-Coders--There it is. Straight from the Horses Mouth.
Morse code is the easiest thing in the world to learn, nothing hard at
all about it. Just a little Pavlovian Conditioning, any ordinary
tapeworm can do it.

So what say let's get off this no-code nonsense and get on with
spending our time advancing ham radio as *Real Hams* and stop this
phoney bullshit of griping about how hard it is. You have every one been
shown up as phonies by one of your Priests of High Technology himself!
Surely you all don't want to be shown up as being dumber than the
average Pavlovian dog's tapeworm, now do you?

Thank you Tom,

I think that we have to realize that people will be people. None of us are perfect and we have to take the good with the bad. Sounds like these people have found the wrong souls to listen to . It is sad that there are enough bad eggs out there to spoil a the fun for a few of us. I think that you need to go back and look again.

In the four years that I have been in this hobby (HAM radio) I have had contact with those "bad HAMs." I have also had patience with these people. You can learn much from anyone, even the ones that make fun and talk big. In the last two months though, I have spent time learning CW. During this time, I have only had support and help through what I thought was going to be the most excruciating task of my life. Everyone has been positive, even my no-code-tech and tech-plus friends. We have a healthy "race" going on. There are many that I know that will not go to the HF bands. They have that right. I want them to enjoy what they do and they want me to enjoy it too. Some of those "no-code people" know the code much better than I. They support me, and I them.

No, you're not inferior, or a non-CW person, you are a Ham. Please try again. Maybe you are trying too hard, or not trying at all.

I will be a friend to the tech or novice, even when I get my general ticket. Look for me, or anyone like me.

73 or whatever you like...

> repairs for this?

Jonathan:

I worked as a tech for Dentron as a young whipper snapper, but has been many many moons ago. I'll see if I can find an old schematic but for starters take a look at the ouput of the transformer itself, I'd go so far as to disconnect the HV from the diode bank to give you a 'clean' measurement. The wires are fairly stiff so you can remove them from the diode/capacitor board, raise them up and use test clips. If I remember correctly (and I may not) the voltage is somewhere around 3kv so I don't recomend touching probes to it. One slip and you'll either be dead or feel like someone hit you in the arm with a baseball bat. (I lived to tell you).

If you have voltage there, your in good shape, at that point you can start looking for an open diode. If one were shorted you'd still get voltage to the filter caps. You can replace it with just about any generic diode of the same rating. If you have no open diodes theres not much left, make sure you short the hot side of the caps to ground before measuring the diodes, do this after the amp has set for a min or two. There were some bleeder resistors on some models but not all. If your not getting voltage at the transformer things are not so hot. You'll need a new one, there is a web site for Peter Dahl, the supplier of the original transformer, where you can get a replacement. The price is around $150 give or take a few scheckles, or I've got one here new which I'll depart with for less. Wish I would have liberated more goodies when the bank came to close the doors! :)

Hmmm, maybe because there is wall to wall foriegn broadcast stations there now.
I can hear a few CW signals trying to hold QSOs between the Middle Eastern
Singers and East Asian Army Opera...There is nothing like listening to a CW
transmission with an Asian Rock Band transmitted via AM warbling in the back
ground while you are in CW mode. Jimmy Hendrix only comes close. :)

Greetings

I can appreciate your emotional comments concerning the disaster in Montreal. I have been watching it on tv almost every night.

With respect to your comments about cw not being used, I think, once the problems have cleared and the amateurs assess their progress, or lack of it, you will find that cw was used in communications. The problem with cw is that most cw enthusiasts, don't shout about their successes.

Unfortunately, it is also very easy to listen to the various vhf and uhf repeaters and hear the messages being exchanged but it is not that easy to listen in on the rapid cw nets exchanging the messages at 25, plus, words per minute.

Before you slam the cw traffic nets, and the use of cw, get in touch with a cw net operate and ask him/her for visit to his/her shack during a time when disaster traffic is being exchange and ask them to translate the cw to voice for you. I think you would be pleasantly surprised as to how much of a part cw is playing in the various disasters that effect us.

Do you mean the TECHNICIAN license class? There is no No-Code
license.

and hey, here in Montreal, emergency traffics are going on the freqs.
Fortunately, the freq where she appears isn't used for emergency
purposes or I should say repeater location is out of electricity.

I don't have anything like your qualifications, but I'd let my ticket lapse, as well. Then a few friends and myself would use our sites to put up a community repeater so we could keep in touch, and join the ranks of those lobbying to give the poorly used ham bands to other services. An expanded FRS could make very good use of a chunk of two meters, for example.

Of course, this is all just idle chatter. Re-testing is never going to be seriously proposed, much less implemented.

I don't think there's much doubt that we are going to eventually lose more of the ham bands. They're just too valuable to leave in the

possession of a few aging hobbyists. Either that, or ham radio will continue to be changed in the direction of a real "citizens" radio service.

I have 146.52 in my mobile and h/t. We have a couple of local folks that QSO on 146.52 almost every night at 7pm. (shrug)

HOWEVER, there are _several_ folks in my area working 52.520 and 52.525. In fact, one fellow, talking on 52.520, but conversing with folks on 52.525, has worked 17 l/d grid squares in the past week, including the East Coast and the Phoenix, AZ area. I myself heard one on 52.525 from Phoenix, but couldn't get thru. I did, however, on 50.125. On _10_watts_. :-)

Howdy! It's time to start thinking about severe weather in Oklahoma, Kansas, Arkansas, and Missouri. To that end, I would like to announce the creation of a new Listserv for folks who are interested in, or already participate in, the SKYWARN program in the states of Oklahoma, Kansas, Arkansas, and Missouri. One does _not_ have to be a licensed amateur radio operator to participate in SKYWARN, although "ham" radio does play a major role in getting information to and from the various National Weather Service offices.

This Listserv will _NOT_ be used for issuing any watches or warnings, but rather to discuss what SKYWARN does, information about training classes, and related matters (including discussion of ARES and REACT). Anyone is welcome to participate (subscribe), but this Listserv will concentrate on the 4 central States that make up "Tornado Alley".

To participate, contact the Administrator for the Listserv - me! :-) Send a message to r_brown@getonthe.net and I'll send you the URL information.

Thanks, and 73 (Best Regards)!

Trying to change the subject of your racism aren't you?

Would you care to explain how your racist posts appeared on ks.misc and not on any other state newsgroups? And would you care to explain how you're so knowledgeable about Orlando being a "crime mecca" and how there are too many "criminals", or is this something you're parroting from the six o'clock news?

Or do you really think that everyone is so naive as to stare into the sun and ask for proof of its existence?

(BTW, there was one previous reply that I wrote and the news server accepted it, but it never showed up as being posted. It may or may not appear.)

Oh, I get it. If there's congestion in your favorite operating time
then we already have too many hams even though 80% of the time
the bands are unoccupied. Is that it?

Which is why I've stayed out of the discussion. Frankly, retesting
makes little sense as others have pointed out. There are plenty
of proffesional licenses holders that don't face retesting and they
involve potentially life and death consequences as in the case of a
doctors.

The reality is that once a license is issued (ham or otherwise)
each individual can pursue whatever interests them. As such, some
subject areas get forgotten while others may be enhanced.
Do I really care what the details are of amateur TV (a
subject I have no interest in)? The bottom line is that if
something interests me I will delve into the technical aspects
necessary. That's true in amateur radio just as it is in
industry. Could every EE today pass their finals they took
in college to get that degree? I doubt it. Ditto for just
about every other ype of license.

In any case...I see no future that includes retesting
and just as well.

There is a fairly new effort to shift the SSB calling frequency
to 50.2 to help spread the contacts over more of
the band (i.e. domestic SSB from 50.125 to 50.300).

>Local AM groups may have their own simplex or calling frequencies

That is 50.4

I actually use 146.52 when travelling and do sometimes manage to make
some qso's. Each summer I go to a friends cabin on several weekends;
it is located in the mountains of southwest Utah; from the elevation I
do better than when travelling the flatlands. Just a quick anecdote:
While stopped to fish in a stream, I got a bit chilled and went back
to the truck to warm up and started calling CQ on 146.52, made contact
with a guy from my home state (I relocated 18 years ago) who happened
to be traveling through Utah and found he was from a town near where I
grew up, the qso was short - less than 10 minutes - but it was a good
qso nonetheless.

Regarding 6 meters, I stick with 50.125 SSB and have a ball - when
conditions are good. Speaking of which, the past few days have been
awesome! Double hops from so-cal to Florida and the Carolinas!! Ray,
I have worked several 0-calls on SSB but not you yet - maybe we will
run into each other on the band. One of the Florida qso's was on, get
this.......AM (yes, it is still used)!

Mr. Rambo I hope this helps your survey.

If I may build on what you started Mike:

And any communications from the affected area to other areas will be
on.....HF! Or perhaps via satellite for the governmental agencies.
But all the H&W traffic will be via HF by hams, though that traffic
will (should) take back seat to efforts to directly support the
agencies in need of communications support - at least that is what my
RACES group puts forth. I live in Southern California and all of our
emergency communications plans utilize VHF/UHF for local coms and HF
for statewide/national coms.

Masa, re-think what is going on and how ham radio is being used to
serve the 'Client Agencies'; in particular what the needs of those
agencies are. Next, discuss with the hams that spearheaded that

support how they would have responded if the Client Agencies asked for support in keeping in touch with any of their sites in let's say Vancouver, BC. You might be using tunnel vision here and that will only serve to limit your own intellectual base.

and now a tribute to Mikes' signature, which still makes me laugh:

to the tune of "George of the Jungle

SON,SON

Trying to change the subject of your racism aren't you? How about
answering why your racist posts appear on ks.misc and not on
any other state's newsgroup? How come you're so knowledgeable about
Orlando being a "crime mecca" which, in another post, also happened to
be on ks.misc and nowhere else?

Proof you say? Proof can be interpreted in different ways depending on the
context in which it is presented, just as I have done. So how about
convincing me otherwise?

Amazing! The spin control and B.S. coming out of the
FCC is still so good that people still believe the FCC &
FCC- CIB are "understaffed."

What is left in the field offices are politically connected
clerical personnel passing themselves off as some sort
of technical specialists. In reality, they are rules &
regulations clerks and telephone clerks hiding behind
impressive job titles that pay them up to $$90,000 a
year! And for that money they sit in field offices with
unlisted telephone numbers, sleeping, surfing the internet,
shopping on government time, leaving early, etc.

They fear & hate Rep. Tauzin because he is on to
their fraud, waste, & abuse. Their days of cheating,
yes cheating, the U.S. taxpayer are just about over
AND they know it! Thus, the last big push to grab all
the taxpayer money they can before Tauzin shuts
down the whole corrupt mess.

Wake up! While you slave at your jobs and the IRS
confiscates up to 40% of your pay checks, FCC - CIB
bureaucrats laugh at you. Ask anyone who has had
recent contact with the FCC. They are arrogant,
lazy, & worthless!

Look out FCC, Tauzin is heading your way!

REPLY...

Actually, I probably have a better chance of getting a response using FM on the 50.125 SSB frequency. SSB operators are real touchy about people using other modes on their frequencies, and are real quick to tell anybody who does so. Hence, a quick response.

A joke people (humor), don't get excited.

REPLY...

The American Heritage dictionary describes an argument as "a quarrel or dispute." It describes a quarrel as "an angry dispute or altercation." Only on rare occasions does this discussion reach that level of discourse. In many cases, we simply disagree with each other (and voice our strong opinions).

Of course, another definition of argument is "a discussion of differing points of view or a debate." We are certainly having that type of argument. So, if that is what you meant, you are correct (besides, I don't want to argue about what an argument is).

By the way, my name is Dwight, not Curtis. Or do you want another argument about people who cannot get names straight. ;-)

>
> A 'test' will not, in and of itself, guarantee competance, ability
> or even a non-anti-social personality.

I think a great many people have the wrong idea about the license tests in Amateur radio. The Amateur radio tests are not, and never were, designed to test competence, or ability. They are just a basic test of rules, safety, and elementary operating knowledge, to be used at a given license level.

The whole purpose of Amateur radio is for non-professional people to experiment, and learn, about radio. The competence, and ability, comes after you get the license (not from the license itself, or from the test for that license).

For example, the Novice, and Technician, tests are designed to keep people from electricuting themselves, frying their brains with RF, blowing up their radio (or themselves), or interfering with the rest of the radio community, while they are learning and experimenting. The other license tests only expand on this basic goal.

Of course, there is only so far one can go with a test - no test is going to stop an idiot from sticking his hands into a 1500watt linear when he should not. But, if the idiot survives, he will have learned something (if nothing else, not to do that).

Anyway, back to the discussion. Read the basis and purpose of the Amateur service as described in section 97. 97.1(b) says the amateur service is for the "Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

97.1(c) says "Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art."

Note the words "continuation," "extension," "improvement," and "advancing," in those paragraphs. No license was supposed to be an end to the goals of the license holder. It was supposed to be a beginning of the learning at that license level. Each license holder is supposed to continue to improve and advance beyond their present level of knowledge (and that includes the Amateur Extra).

What I am trying to say is that each test is an introduction to what is needed to safely learn during the next level, not necessarly a test of stuff learned in the last level. The amateur is supposed to take

what is on that test and go out in his/her world and apply it (through experimentation and usage).

To take this further, no amateur license, or test, is supposed to be designed to keep people out. Part 97.1(d) continues on to say the purpose of Amateur is the "Expansion of the existing reservoir within the radio service of trained operators, technicians and electronics experts.

So, a primary purpose of Amateur radio, and by extension the tests, is to bring people in, not to keep people out. This purpose is different from say the commercial radio license, or even the pilot license you mentioned.

In each of these cases, the people receiving the license are using them out in the real world (where people's lives, safety, or comfort, depend on these people).

In the case of the commerical radio license, the holder of this license is responsible for insuring that the information, which might affect people's safety or comfort, continues to reach them. This license is designed to insure the license holder is capable to doing that. And the purpose of the pilot license is obvious.

But, this is not the case of the radio amateur. Others do not HAVE to depend on us for their safety or welfare. Note this is different from where we volunteer to offer such services and people choose to depend on us for information which might effect their safety, or for the exchange of information which might affect their welfare.

The amateur radio service exists mainly for the amateur radio operator to learn. It is the amateur radio operator who receives the benefit from the amateur radio service (through self-education).

The tests, at each license level, are only designed to give the operator the basics needed to continue that self-education at that license level. They are not a test of competance, or ability, at that license level.

Of course CB didn't come along until about 1957 or 58. I operated 11 m as a beginning ham in 1956-7 when the band was screaming (as were all bands). Had a ball working the hi freqs when the sunspot cycle was fabulous! CQ 10 ... This is K0DON..... Let the fun begin.

I entirely agree. It appears the debate, although centered on the Morse issue, is really about who we should keep out of amateur radio. Although there are some among the pro-code group who are sincere in their views about the merits of code, I think most defend the code requirement simply because they fear the unruly hoardes which might be unleashed onto their bands. The thing that none of them would admit is that they are not so much pro-CW as they are anti-CB. They aren't as much pro-code as they are anti no-code. They use their "virtue of code" arguments as camoflage for their deep-seated resentments of those with views and values which differ from theirs.

Who we should keep out, or rather how many we should keep out - perhaps that's the issue. The more people we keep out, the more "special" we are - the more exclusive the club, as it were. Those who show the greatest concern, I feel, hold this "exclusivity" in highest regard - higher even than code itself.

It is their fear that motivates them to defend the code tests against all reason - fear of losing.....something. What else besides fear - fear of the unknown perhaps - could explain the ferocity with which they maintain their claims about the necessity for a radio operator to manually modulate and demodulate the encrypted message on a carrier. Yes, CW is a unique feature of the amateur service - one which will naturally persist until the point when, if ever, it becomes completely unsatisfactory to use by everyone under every circumstance. Personally, I would mourn the loss - just like I mourned the loss of our national treasure Jimmy Stewart. That loss was of course inevitable.

The code group argues against something which nobody here has proposed or would wish to achieve: to make getting licenses easier for it's own sake, and to let the un-ruly take over the bands. And they do this using the

guise of upholding standards and defending the practicality and efficiency of Morse.

There is no "need" to make licenses any easier to obtain. There is likewise no need to make it more difficult than necessary. (After all, not everyone aspires to be like us!) The best thing you can say about the code requirement as a filter is that it sorta keeps potential LIDS out - kinda - as well as other folks. But all of the exams do this - with similar efficacy.

It's probably true at this point that 1A "filters" out a greater number of people than does element 3A. On the other hand, elements 3b and 4 probably "filter" out more than element 1B. This should argue for a shift in that direction - toward more comprehensive written exams, and away from code exams.

All it should really take to appease the loyal opposition is a proposal to change the exam structure in such a way as to maintain the current efficacy for "LID filtering" as a replacement for the code test. That efficacy is not significant, but it is also not negligible. A suitable answer for the question of "maintaining standards" will have to be found before there could be hope for resolution on this issue.

These notions of work ethic, earning a license, devotion to the hobby/service, must eventually be dispelled and give way to discussions of requisite and relevant operator qualifications. Morse could continue to be a part of that discussion. But our emphasis in testing that mode should ultimately fall into place along side the other equally important modes we use.

Until then, I guess we'll just continue to hear about how hard some of us worked for our license back in the old days, and how lazy and whiney everybody else is. Keep it coming guys, it's really impressive to listen to - and oh....very persuasive as well!

73,

AC6XG

You're putting "ifs" and other conditionals in my post which I did not
mention, nor did I intend.

My wife has a B.S. in English. She received it in 1984. The field for which
she was a "qualified practitioner" is saturated in our area (N.E. Ohio)
Since 1984, she has worked as a payroll clerk, and promoted to Senior
payroll clerk in 1989. Certainly not the profession for which she schooled
to become a "qualified practitioner".

By your reasoning, she should retake all of her finals in English studies
so that she can continue to keep her job as a payroll clerk. (BTW, she got the
job because of her degree. The company didn't care what it was in)

Ergo, I should retest in fields of satellites, EME techniques, DX operating
procedures, and a host of other stuff I don't use and never will, just so
I can continue to check into a couple of nets.

Someone else posted that if retesting ever materialized, they'd let their
license lapse and then lobby to sell off the amateur bands to the highest
bidder.

You can count me in on that as well.

>it all if I jumped right into 2m. And now we want to give HF phone priviliges to
>the same group of guys I hear on 2m who aren't really interested in radio.

Did I miss something? No one has suggested giving
HF to techs. To get on HF the tech would still need
to pass the general exam... unless he or she just wanted
to operate in the novice segements.

>Well
>perhaps it will come to that someday. I joined because I had an interest in
>shortwave radio, communications, electronics and I was willing to pay the price,
>which at the time was learning morse.

That doesn't mean that requirements must be forever static.

> If it mean becoming proficient in another
>language I would have done that too! If you want it, pay the price.

No has suggested otherwise. What we have suggested is
that it is time to change the requirements.

>Rite of
>passage? Old farts club, secret handshake society, I don't care what you call
>it. I'm going to continue to support it for HF priveleges.

Sadly, this comment says it all. You look at CW testing as
nothing more than an initiation.

>Wayne Green argued for years about all the wonderful RF Engineers, Microwave
>Specialists, etc who would bring a wealth of knowlege to our hobby but wouldn't

You might try calling International Computer and Radio for the real deal on
their aftermarket filters. I have not personally bought any of the product
line, but reports over the years seem to bode well for the company.

Yeah Morse Code is a big secret. If I tell you, I'll have to kill
you...;-]
>
> There is no legal right for these sorts of things to exist where publicly-owned
> radio frequencies are involved and a license issued by the government is
> required in order to participate.

Isn't the 'government' and the 'public' the same thing? Do you
think the 'gov' doesn't have the right to test us for driver
licenses so that we can drive on 'publicly-owned' roads?
NOTE: I guess I should be careful here. There are groups
that think just that. Don't want to start up another
thread with the survivalist/patriot/anti-gov group.

I think the 'government' tests us for a lot of things. Ham
licenses, poultry inspectors, plumbers just to name a few.
Surely every one of those tests include stuff which the
licensee will not use every day.

The day I turned 16 and got my driver license I was proud.
The day(s) I passed my ham license test(s) I was proud.
Take away all of the goals and what's there to be proud of?
Is anyone 'proud' of having a CB license?

Just my observation - Lumpy

Sure, because there is a compelling interest in doing so. Public safety.
There was once a compelling interest for the government to require Morse
knowledge as a condition of obtaining an amateur radio license. Technology has
progressed to the point, however, where this is no longer the case.

There you go again, Dick. Gary said absolutely nothing about tapeworms
learning Morse code. He talked about flatworms learning how to run
mazes. Can't you even get such a simple set of facts straight? Are you
so ignorant that you don't know the difference between a flatworm and
a tapeworm?

Ahhhh Walt, you missed the point. In the "early 50's", 11m was a ham band. I remember an 11m contest to try to get the interest up and save the band for hams.

REPLY...

In section 97.1 of its rules, the FCC describes the basis and purpose of the amateur service. One of those principles is...

97.1(d) Expansion of the existing reservior within the amateur radio service of trained operators, technicians and electronic experts.

Amateur radio is about bringing people in (expansion), not keeping people out. If CW testing is an unnecessary barrier to that, then CW testing needs to be removed.

Well, if all are not on for 17 hours and all is congested for 7 hours then only 30% of the total useable time is being used. Since 7 hours is the only time used then it is 100% of the operating time and we can say that the bands are congested 100% of the time. This being the case, we must have too many hams.

Cecil is playing with words again, trying to make everyone else look stupid, a favorite passtime of his.

What he is actually saying is that the users of 11 meteres in the early 1950's--hams of course--sounded *exactly* like the rifraff they were at the time!!

This is not his first excursion into wordplay where he implies/insinuates/indicates one obvious meaning, then tries to make a reader look like a fool when he "misintperprets" Cecil's wording.

Of course no misinterpretation took place, it's just that Cecil likes vague, double and triple meaning phrases intended to confuse. We're on to you Cecil, Old Chop!

No wonder he doesn't like to talk to strangers on the air. I'm beginning to think Cecil doesn't like ham radio operators any more than Lennie.

Message-ID: <fkelcz.291.00CDD687@facstaff.wisc.edu>
Source record: 181617

Hi All,

Will be going to Australia in a few months and was thinking of taking along 2m/440 HT. However ARRL site seems to imply $50 fee, regardless of how short the visit or the bands used (in contrast New Zealand is NO fee if use > 2m for < 4wks). Am I correct in this?

Is there the equivalent of Family Radio Service/GMRS (462/467 Mhz) in Australia - I am already licensed in GMRS in USA, and could be helpful for short range (simplex) comms between the wife and I (she is not Amateur licensed).

Thanks for any info and help. Please email as I don't frequent this board.

Ah, you came up with a Q5'er! Those were more scarce down here in the sticks than the proverbial hens teeth! They weren't to be had even from Fair Radio. (I've got one in the junk box at this time, now that I have no use at all for it). I did the cheap and easy mod, pull a couple plates out of the tuning variable cap. and spread it out by about twice. No too bad, and the *training* and the *skill* I developed on that rig has served me well, even throughout my communications carreer. I could always pick out and understand noisy signals -even voice- where most people without that sort of background couldn't!

It may be illegal in the US of A but not everywhere......here in the Great White North it is legal to listen to any wireless signal be it celluar phone, baby monitors, cordless phones, gov't stuff or anything else as long as you don't repeat it or use it to your own benefit... ie...stock market etc.....Whats the difference between listening to your neighbour on a cell phone or listening to the police making a report about your neighbour (which, I believe, is legal in the U.S.A.). If you are using a wireless transmitter, you should have the common sence not to devulge any personal information over any wireless transmition anyways....

Allocations of frequencies aren't private by anymeans and if you have the receivers to receive or the software to decode then you should have the right to listen.....it may not be moral but it shouldn't be prohibited.

There are mods on the internet for just about any amateur radio to receive cellular as well as non-distructive mods (non-permenent) for most cellular phones to become cellular scanners. And I'm sure that someone is working on or has already developed a way to decode digital encryption for celluar phones.....it's only natural...something we can''t have, we want!!

My 2 cents worth anyways....

Yes. The article from the one who did not want to have to be retested for his pilot's license was scarey to me. Being a pilot is a career from which the person usually hopes to make a living. It is also a service that involves the handling of other people's lives. If the pilot is incompetent, many people can die in a plane crash.

Amateur radio is not the same ball game. Amateur radio is not a career. In fact, hams are prohibited from making money from their services, as it should be. I do not support the idea of retesting, and I think that most hams in America would agree with me on this one. It is just too impractical, expensive, and unnecessary.

>Trolling, trolling, trolling...

No, I don't think so. I think that looks like a legitimate question, so let's give old Dano an answer. MARS (Military Affiliated Radio Service) is something that functions with volunteers from the amateur service and a few GS-5's thrown in for good measure. They do things like making phone patches for military people overseas.

They operate normally just outside of the ham bands, on formal military type nets. MARS is being downsized in some branches of the service now.

Most hams I have met who joined MARS joined for one reason:

They have access to free surplus radio equipment from the military junk yard.

Hams, and I believe some radio manufacturers, also use the 'MARS' excuse for modifying radios to work on frequencies outside the ham bands. Probably two percent of the people who are a) looking for 'MARS' mods or b) have radios with 'MARS' mods installed actually belong to MARS.

Anyway, Dano, I don't personally know anybody who has spoken to the planet Mars, or the other ones you mentioned, on the radio but I did meet a ham one time who talked to God on 40 meter CW.

I would talk to her. The fact that her conversations can be herd by
someone else maybe motivation enough for her to by a cheap 900mhz
cordless. You might also mention that anyone with a scanner can hear
too.
good luck, kevin

Too bad. Otherwise you might try to catch the governor's cellular call to the prison warden on your scanner. Sure would be more interesting than listening to Chuck and the Cow Camilla.

I am sure Pro-CWers suggest school kids to learn abacus and
use this old obselete "mode" which requires a lot of effort for some
people instead of plug 'n play calculator.

Abacus features:

- Requires practise to use it
- Old mode. More than 1000 years old.
- Very slow.
- Inaccurate
- Can be used during the Emergency because it doesn't use any
batteries (so what ?)

If you really force school kids to learn Abacus, you must be
really silly. (don't take me wrong. I know abacus and I
sometimes use its method when I calculate something in my head.
I always complain something after I try it... I have a qualification
that qualifies 10 9-11 x 25 digits +/- calculations within 10
minutes, 20 6-7 & 6-7 x or / calculations within 10 minutes and
more...)

This is very similar to CW/No-CW debate. CW requires practise, old
mode, relatively very slow, inaccurate and "could" be (?) used during
the emergency... but if you really think CW is heaven and does
everything, you are deadend.

Be a pro-abacus and many don't care.
Be a pro-CW and many don't care.

> > I am most surprised to see the above comments from Carl
> > who I thought was opposed to arbitrary "barriers" to entrance
> > to the Amateur Radio service.
>
> Note that I questioned the "dedication" of those for whom
> ham radio "was not worth" $100/year in fees (that I suggested
> should be earmarked for use by the FCC for enforcement in the
> ham bands from which the funds came.)

Of course you well know that FCC does not obtain operating funds
from fees, but from congressional budgeting action, so your $100
per year fee is simply an arbitrary barrier to entry.

"Dedication" is not a condition of being a licensed amateur. Another
arbitrary exclusionary notion from Carl.

> > Now Carl would support a $1,000 (10 years x $100) "entry fee" for
> > a teenager getting his first license, or a young wage earner trying
> > to support a new family!
>

> $1000 in cold, hard cash ... I said $100/year ... pay the $100
> when you first get the license, then send in $100/year each year
> or your license gets cancelled ...

Of course, you also well know that the US Treasury does not have a
"pay as you go" plan. You pay full term up front cash.

> > Or maybe just rich kids should become hams?
>
> 2 bucks a week is not exactly "rich people's country" ... we're
> really talking about what amounts to pocket change for a *huge*
> majority of the population ...

It *is* "rich people's country" when 10-year pre-payment of $1,000 is
required.

I think most all of us (no matter what position we take on the issue
of Morse testing) would agree that introducing young people to the
Amateur Service hoping that they might thus become interested in
technical and scientific careers is a "good idea". Your notion of
"entry fees" is exclusionary and flies in the face of 97.1.

> Sorry, Hans ... like most ARRL officials, you've lost touch with
> REALITY (LONG ago).

You're out of touch, Carl. I am not an ARRL official.

Carl R. Stevenson floated the notion of $1,000/10 year term
licensing fee for amateur radio, and then said:

> Many "avocations" require the dedication of some degree of
> personal resources for equipment, supplies, etc.

Any avocation which depends on tangible items (radio equipment,
stamps, model airplanes, etc.) require some expenditure for those
tangible items.

I know of *no* avocation which depends on a $1,000 expenditure for
non-tangible "permission", except perhaps country-club golfing.

I hope Carl does not feel amateur radio should be as exclusionary as
country-club golfing.

That's typical of the "Morse Forever" CW Olde Farte who dominates the ARRL/FISTS/etc. ... who was barely competent with a 2-tube rig (if that) and stagnated into complete incompetence when more modern technology like semiconductors, microcontrollers, DSP, etc. became practical realities, even in every-day, low cost consumer devices.

However, they are quick to allege their "superiority" on the basis of beeping "skills" ... and rail against anyone who tries to teach them a thing or two about what's happened in the REAL world of communications technology since about the mid 40's.

He is, but go on.

>> Note that I (Carl) questioned the "dedication" of those for whom
>> ham radio "was not worth" $100/year in fees (that I suggested
>> should be earmarked for use by the FCC for enforcement in the
>> ham bands from which the funds came.)

>Of course you well know that FCC does not obtain operating funds
>from fees, but from congressional budgeting action, so your $100
>per year fee is simply an arbitrary barrier to entry.

The FCC source of its operating budget may be that way now...
But congress CAN just as easily legislate to allow FCC fees for ham
licenses AND specifiy that those amateur fees be strictly used
to enforce amateur rules. Carl's $100/year strawman is probably
high, but I'd happily pay 10-25 dollars a year if the fees were
so dedicated. Frankly, I know of NO hobby that doesn't have
some costs associated with it. Surely $10 or $25 a year isn't
cost prohibitive for most hams.

>"Dedication" is not a condition of being a licensed amateur. Another
>arbitrary exclusionary notion from Carl.

Nope, you got that wrong. Carl was just showing that if
DEDICATION (as oft cited by pro-code test advocates
who say passing code shows the dedication to the hobby)
is the concern, then it can be addressed in other ways,
one of which is a license fee.

>> > Now Carl would support a $1,000 (10 years x $100) "entry fee" for
>> > a teenager getting his first license, or a young wage earner trying

>> or your license gets cancelled ...

>Of course, you also well know that the US Treasury does not have a
>"pay as you go" plan. You pay full term up front cash.

Again, not likly but annual fees could be legislated bu congress.
The example by Carl is exactly that, an example. To cite the
way it is now is not reason that it couldn't be done differently.

>> > Or maybe just rich kids should become hams?
>>
>> 2 bucks a week is not exactly "rich people's country" ... we're
>> really talking about what amounts to pocket change for a *huge*
>> majority of the population ...

>It *is* "rich people's country" when 10-year pre-payment of $1,000 is
>required.

Mistatement of what Carl wrote again. Carl said $100 per year.
I pay that for my auto registration every year. The same COULD
be done by the FCC if Congress allowed it by legislating the
necessary changes in law.

>I think most all of us (no matter what position we take on the issue
>of Morse testing) would agree that introducing young people to the
>Amateur Service hoping that they might thus become interested in

>"entry fees" is exclusionary and flies in the face of 97.1.

That might be true for 17 and younger, although I doubt
it.... but 18 and over
are all adults and quite capable of paying such fees.
Go to any mall today and watch the kids shop for $15
CDs, $50 jeans, $100+ sneakers, etc. The typical youth that
MIGHT become a ham isn't likly to be recruited from lower
income groups anyway. Given a fee structure, I'd happily
contribute to any bonified youth that was truly needy
in terms of making such a payment.

>Dick W0EX

Irrespective of the difficulty of the theory test, the
bottom line is that the CW test doesn't result in any
net deifference in the quantity or type of bad apples
found on VHF versus those on HF. Dick would
have us believe that the bad apples on HF are
the result of lax CW testing, yet that is simply speculation.
I've seen not one shred of evidence that suggests
that the bad apples are all relatively new hams who only
got on HF after the testing process for CW was
changed. Indeed, no matter how you cut it, passing
the 20wpm CW test by the multiple choice method
still probably requires the ability to solidly copy 13 or
better. That being so, how does Dick explain the many
Extras that the FCC has fined or lifted licenses from
because of all types of bad apple behavior.

>> Any test will keep out
>> some people and the if bad apples only stay away because
>> of code, then why doesn't VHF exhibit a proliferation of
>> bad apple behavior any more than HF does?

Dick's reply above is speculation only and
certainly doesn't answer this question.

I have a Ranger 2950 fully modified, clarifier unlocked, heavy swing mod, green display lights, peaked and tuned, receiver enhanced, and it is in like new condition. It is a year old and has the old style CPU (the best). It has only been used as a base station, never in a vehicle. It looks and works like new and I'm asking $180.00 I also have a Dosy TC-4001-P Test Center meter which is the lighted model with headphones for monitoring modulation. It too is just like new and I'm asking $65.00. I have an Outcom 200 watt mobile linear in near new shape and I'm asking $100.00. If your are interested, email your reply to me at: mcallister_j@yahoo.com

Thanks,
Jim McAllister

There is a substantial body of research on biological effects of RF on humans. Much of it was done with a water-filled model of the human head. I'm not sure of the exact authors, but you might start with studies done by Dr. Quirino Balzano of Motorola. I'm sure there are references contained within his papers. It's been a few years since I looked at any of this research.

Bullshit, Hans ... I SPECIFICALLY STATED that the fees would have
to be earmarked for FCC enforcement in the ham bands ... and I
acknowledged that that would take Congressional action to pass a
law to that effect.

> "Dedication" is not a condition of being a licensed amateur. Another
> arbitrary exclusionary notion from Carl.

Tell that to all of your pro-code buddies who INSIST that everyone must
have to "work for their license" and "show their serious dedication to
ham radio" (by submitting to the forced learning of Morse code and the
testing/hazing ritual that present rules require, of course.)

> > > Now Carl would support a $1,000 (10 years x $100) "entry fee" for

More bullshit ... Congress could easily pass a law that would permit annual payments over the course of a 10 year license term ... if you don't pay, your license is revoked ... that's not so complicated, Hans, even you should be able to grasp the concept.

> > > Or maybe just rich kids should become hams?

That is YOUR fantasy/distortion ... it is NOT what *I* said. Please constrain your criticisms of my suggestions to what I actually suggest, and leave out your usual self-serving lies/distortions. (I know you pro-coders have REAL difficulty in being honest/fair, especially when you have nothing sensible to say, but please at least try.)

Gee, Hans ... last I knew you were an ARRL Vice-Director ... did you lose in the recent elections? Since you were not *my* Vice-Director, I did not notice the change, though anything that gets people like you out of office at the ARRL *HAS* to be a "good thing."

Hans floated a self-serving, distorted misrepresentation of
what I said (as is his usual practice with anyone who is not
in the ARRL/FISTS/pro-code camp) and then said:

> Any avocation which depends on tangible items (radio equipment,
> stamps, model airplanes, etc.) require some expenditure for those
> tangible items.
>
> I know of *no* avocation which depends on a $1,000 expenditure for
> non-tangible "permission", except perhaps country-club golfing.

What difference does it make if the expenditure is for "tangible" or
"non-tangible" things?

> I hope Carl does not feel amateur radio should be as exclusionary as
> country-club golfing.

Gee, Hans ... I would assert that amateur radio *has been* AT LEAST
that exclusionary and elitists for decades ...

The Morse requirement is about as relevant to qualifications for HF
access as is the color of one's skin to one's ability to play golf ...
you code bigots have exercised your own form of discrimination that
is as arbitrary and unjustifiable as racism for decades in order to
exclude those "who are not white enough" (those who don't beep to your
satisfaction) from your "country club" on HF.

Just curious what various operators think. Should stations do
everything possible(within financial reason) with respect to general
station setup and engineering, to confine their SSB signal to a 6 KC
spread?
I have always thought this was part of good operating proceedure,
however, some of my recent e-mail would lead me to the conclusion that
this is no longer considered true.

"Memorize" is somewhat of a misnomer, one I myself am guilty of using.

With a question pool exam program, it is very easy to drill on the
question pool a sufficient number of times so that you become
conditioned as to what the "correct" answer is to a question. You
don't actually "memorize" the question and the correct answer, you
just learn to recognize the question, and what the answer is.

This is the same type of situation people who use code tapes for
practice run into. They end up "memorizing" what is on the tape (no,
they couldn't write the tape down verbatim, but as they are listening
to the tape they remember what is coming up next...) effectively
rendering the tape useless. That's why on-the-air QSOs are much more
effective for building up code speed, not tapes.

Upon re-reading my quote, I realized that it sounded exactly
like something Stevenson would have posted. What's pretty funny
is that you flame me for making the same comment which Carl
has made on numerous occasions. But, I guess I get flamed for it
because I'm a "pro-coder" and not a "anti-coder" like Stevenson.

>What is wrong with an amateur who likes to communicate for
>fun, maybe doesn't have a technical background, and who
>isn't a "dedicated" communicator? Nothing, that's what.

There is nothing wrong with this type of person, but the
amateur radio service isn't the radio service for them.
There is nothing wrong with communicating on the radio for
fun -- 80-90% of my operating time is spent on the air
having "fun".

However, when the bands start to turn from amateur-related
discussions to pure FRS-type traffic, I think we have a problem.

Why? Well, for one, if all we have on VHF is FRS-traffic, then
obviously we don't need our VHF bands, do we? All our VHF bands
can just be sold, and the existing users (and their FRS-traffic)
can just as easily migrate to the FRS band.

Some things in moderation are not bad. There is nothing wrong
with FRS-type traffic in moderation. When it becomes the principle
use of our bands, though, I think we're in serious trouble.

Radio THEORY (knowledge of SSB, ATV, etc.) is something entirely different
than knowledge of rules/regs/safety issues.

Radio THEORY is completely unnecessary in today's predominently
store-bought, appliance-operator world.

The statement you made, as modified, fits.

There are people who can learn code in perhaps a day, weeks or two weeks
as you suggest. There are others who in fact have spents months and
years working to not suceed with Morse. One of basis of NoCode
positions (the better ones at least) are that the skills needed to learn
and use Morse are unrelated to the other priveldges that require it to
be learned. I have yet to see anyone explain how being able to
transcirbe text from Morse makes me better to use Voice and Packet modes
(esp the latter I would not even hear a CW signal after I have started)

Have you ever noticed that the ones with the *cool* names (cutie boy, the cool guy, etc.) do the most posting, say the most inane things, lack any intellectual substance and thrive on the reactions provoked by their bigoted posts? It is this reaction that they crave. They use any and all means to keep the spotlight and attention on themselves. Why else would you post the same message twice within approximately five hours? 10:38 and 5:29 [Ans: Because you did not provoke a large enough response the first time.]

Their posts never (?) list their real name. These people are ashamed to put their name on what they post. They hide behind facades and snipe at everything -- people, principles, customs, mores, the old, the young and anything else they cannot comprehend.

They are the herpes of newsgroups --- nothing fatal, but a source of constant irritation.

I agree with this, if it is "pure." I have no perception
that we are anywhere remotely near this situation, either on
VHF or HF. We sure aren't in Southern Calif. 99% of the
VHF activity is plain old QSOs, very much like HF.

I had that radio and the mod is simple. If you remove the top cover to the radio and look
directly behind the display PCB you will see a wire with a small black switch. Simply
move the black switch and you can transmit 100 watts from 1.6 mhz to 30 mhz.
It is legal to Transmit anywhere you want if there is an EMERGENCY that involves loss
of LIFE or PROPERTY.

The Trading Post is a place your can read or post amateur
radio, scanner or
shortwave equipment. Items will be posted for 30 days or
depending upon the
amount of post on the board. Be sure to include any
contact information and a
honest description of your gear for sale.

http://disc.server.com/discussion.cgi?id=7181

Thank You,
Kyle

Oh boy .. you best stand by on this one.

Are you are under the impression that a SSB signal covers 6 KC of
sprectrum ?
A SSB signal that covers 3 KC would be a bit broad by todays standards.
Typically
it would be from abt 2.8 to 2.3 KC .. depending on the filtering. Some
receivers
have a narrow filter for SSB that is 1.8 KC, so 1.8 KC is plenty wide to
understand
a SSB signal, or either side band of an AM signal.

If you are transmitting on, for example, 7200 KC then on LSB your signal
will
be from 7200 down to about 7197.2 (or less). For USB it will be from
7200 up
to about 7202.8 (or less). This is on a clean rig of course.

An AM signal, designed to good communications standards, on 7200 would
have
a signal from 7203 to 7197.

I think you are missing the real point. Morse code is a flawed code. No upper and lower case, no curly braces, etc., etc. Way too primitive for the 21st century.

Two suggestions. I think what we should be doing is learning to send ASCII or extended ASCII using dits and dahs. All characters would then be 7 or 8 units long. This would allow us to uuencode pictures of our families and not just do the boring: TNX FER CALL OM = UR RST 599 and so on.

My second idea is to sample all CW QSO's for one month and come up with extended numeric macros. Just as 73 = best regards, #672 would be: NAME HR IS DAVE DAVE and #362 would be WELL XYL IS CALLING FOR DINNER SO 73 AND CUL. Wouldn't need a PC or UNIX box even. Just a Palm Pilot.

Of course, then we get a lot of folks wanting a No Pilot class of license....

ME TOO!!!!!!!!!!

Do you suppose that maybe that's just what the government wants you to do?
Perfect solution as far as Washington is concerned...they no longer have to
bother with amateur radio issues and can make big $$$ by selling off the
spectrum.

Even more need for this filter.

How about we let the courts decide the relevance (or lack thereof) of Morse code testing in 1998? This is ultimately where the matter will end up.

Greetings Dwight,

Myth about cw? Not sure which myth is referred to above, however I think you hit the nail on the head with, "If CW is an unnecessary barrier..." That is the big question. Is it really unnecessary? Has it been necessary since the invention of voice modulation? What defines the term, "necessary"?

I for one am still undecided on the code testing issue. I am leaning toward a license structure where certain portions of the HF bands are restricted to CW use and make access to only those portions require cw proficiency testing. Then the question pops up, How much and which part of each band will be reserved for cw? Whew... I remember the debates and arguments over incentive licensing. People were whining about that one for years after it was done.

Just food for thought...

Regards, Frank

>
> I am most surprised to see the above comments from Carl
> who I thought was opposed to arbitrary "barriers" to entrance
> to the Amateur Radio service.

Note that I questioned the "dedication" of those for whom
ham radio "was not worth" $100/year in fees (that I suggested
should be earmarked for use by the FCC for enforcement in the
ham bands from which the funds came.)

I don't see legitimate licensing fees with legitimate purposes
where the funds are used for the betterment of the service as
being at all "arbitrary."

> Now Carl would support a $1,000 (10 years x $100) "entry fee" for
> a teenager getting his first license, or a young wage earner trying
> to support a new family!

I never suggested that anyone would/should have to come up with
$1000 in cold, hard cash ... I said $100/year ... pay the $100
when you first get the license, then send in $100/year each year
or your license gets cancelled ...

> (And we haven't even started to talk about
> actually assembling a station yet!) Can you imagine ANYONE, even
> a reasonably affluent adult, plunking down $1,000 to get a simple
> license to engage in an avocation?

See above and PLEASE stop adding your own, ridiculous, self-serving
distortions ...

> He calls it equivalent to a nice dinner for two and a couple of drinks.

For most folks who can *really* afford the time and expense of ham
radio, that is true ...

> for the folks we want to
> get interested in this hobby, a "good dinner" is a #2 meal-deal at the
> local McDonalds, or the special down at the university cafeteria, not
> lobster and chardonnay at the Hilton.

Lobster and Chardonnay at the Hilton will set you back more than
$100 ... anyone who uses "McDonalds" and "good dinner" in a serious
manner with the intent of implying that the former and the latter
actually have any overlap in THIS universe is clearly deluded :-)

Remember, we're talking about a lousy 2 bucks per week here, not some
exorbitant amount ... most high school and college kids will end up
being subsidized by parents and/or their own initiative in having a
part-time job.

I would have no problem in exempting students under the age of 21 from
low-income families from payment of the fee, either ...

> Or maybe just rich kids should become hams?

2 bucks a week is not exactly "rich people's country" ... we're
really talking about what amounts to pocket change for a *huge*
majority of the population ... I'm sure that there will be some
group of welfare-state-minded-liberals (like those who insist on
government-mandated life support for Morse) who will figure out
some scheme for subsidizing the hordes of homeless hams who can't
really panhandle an extra 2 bucks per week to pay their license
fees (you know, the guys with the all-band trap verticals and
solar arrays on their cardboard box houses in the local alleyways).

In other words, please cut the crap about the suggestion for
a $100/year license fee (earmarked for enforcement) being "elitist"
and "exclusionary." 99.999% of the population who could afford
ANY other aspect of ham radio (gear of ANY kind, a place to set up
a station, any time at all away from pursuing basic survival needs,
etc.) can find a (legal, legitimate) way to come up with 2 bucks a
week or qualify for an exemption.

I don't have a hang-up about the $100/year figure ... it could just
as easily be $50/year or even $10 ... I REALLY just wanted to see how
much the pro-code faction (who bitches and moans about how forced
Morse testing is "necessary" to require one to "work for one's license"
and to "prove dedication to the hobby") would react to the concept of
actually having to "put their money where their mouths are" ...
THE REACTIONS HAVE BEEN QUITE PREDICTABLE ...

> Sorry Carl, you've lost touch with the meaning of "avocation".

Many "avocations" require the dedication of some degree of
personal resources for equipment, supplies, etc.

Sorry, Hans ... like most ARRL officials, you've lost touch with
REALITY (LONG ago).

Readers of the above should take note that, as usual, Mr Kehler has "put words in my mouth."

I have NOT "submitted a proposal for licensing fees to the FCC" ... I simply stated here that, perhaps, those who rail about how one must "work for one's license" and "prove one's 'dedication to the hobby'" (through the current program of forced Morse learning/testing, of course) should have no problem in "putting their money where their mouths are" if the money was earmarked for FCC enforcement in the ham bands ...

Seems that the pro-code crowd has a problem both with "dedication" AND with the idea that there might be some REAL enforcement of the rules. (This seems to correlate with the fact that, by far, most NALs are issued to coded hams with "higher" class licenses.)

Strange, I keep hearing about the garbage on the repeaters
but when I drive around the northeast I find no such behavior.
Even on a comparative basis, HF phone (i.e. speech) is
no example of exemplary behavior. Comparing phone and
CW verbige is pretty dumb anyway as few people encode
(or type) profanities.

All that I want to add is. Radio freq. Move Thru FREE space. They also enter my home and my body. I feel that if these wave enter my home or body I can do with them as I please. This means I can take these waves that enter my home and demod them the way I want. I have a right to know what is in my home, in my body, and in FREE space.

Carrier always present? Nope. The carrier can be keyed.
Our 500 kHz transmitter at radio station NMO was always
kept in the A2 (MCW) mode with carrier being keyed. Listened
to with a receiver's BFO turned on sounded beautiful - the BFO
mixing with the transmitted tone created all sorts of lovely
harmonics, broadening the transmitted signal.

Try "sending" code by pressing your arm up/down on a piano keyboard
to get an idea how A2 through a BFO sounds.

Jeff KH2PZ, H0CW

P.S. Snipping the filter caps in the B+ of your transmitter's
power supply will modulate your CW signal with a 120 Hz "tone."
Good for breaking through pile-ups. (Not legal in the U.S. -
wait until your next DXpedition to Cuba to try it.)

Trying to have a QSO on 40 meters nowadays is damn near impossible. What with the broadcasters in the way and all. Boy I'm so glad I got a portion of a useless band when I got to tech plus. I will say 80 jumps at night though with CW.

73,
Tom

The battery pack for the forthcoming SGC 2020 seems gargantuan...10 D cells. A "cast of thousands" to take out into the field. Seems like few hams will power up the rig this way. Otherwise, sounds nifty from the specs.Wish the Canadian buck wasn't underperforming right now. That exchange rate would really blackjack me.

1402. QST Digest - last issue (Long - 32k)

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-14 00:00:00 UTC
From: wvanho@infinet.com
Message-ID: <69i4po$oom@news1.infinet.com>
Source record: 181661
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

Final Issue of QST Digests -

Following are digests of articles printed in the December, 1997 issue of QST. Such digests were prepared for each issue of QST from January, 1993 through December, 1997. No more will be issued. They are archived, and available by ftp from:

(in USA) oak.oakland.edu/pub/hamradio/arrl/infoserv/digests
(in Europe) ftp.funet.fi/pub/ham/arrl/infoserv/digests

They also can be gotten by E-Mail from the ARRL Info Server at: info@arrl.org. For detailed instructions, send an E-Mail message containing the following:

HELP
INDEX
QUIT

Another access route is via the ARRL HIRAM bulletin board. It can be accessed by a direct telephone call at any speed from 1200- to 28,800-baud. The number is: (860) 594-0306.

The major value of digests is to give readers sufficient information to decide whether to obtain a copy of the full text. If any U.S. reader wants a copy of an article in QST, please inquire of other hams in your own neighborhood. Many have collections of back issues. Anyone who is unsuccessful in finding a fellow ham with a collection should try every library in the area, especially those at universities and technical colleges. If all else fails, a copy can be obtained from the ARRL Technical Department, 225 Main St., Newington, CT 06111-1494 USA for a fee of $3.00 per copy for ARRL members; $5.00 for non-members. Remember, it is both cheaper and quicker to obtain one locally.

Readers in most other countries can obtain copies from their own national ham organizations, sometimes translated into their own languages.

TECHNICAL ARTICLES (TA)

Title>TA1:A Computer Keyboard CW Encoder
Author>Alspaugh, Ron - W6NKS
Source>QST Dec 97, pp. 32-35
Abstract>Describes a CW encoder that uses a computer keyboard, without a computer. Contains construction details for a controller circuit. The author offers a pre-programmed CPU chip for sale, but not source code.

Digest>W6NKS describes a Morse-code generator that responds to input directly from a standard computer keyboard, without a computer. The only added hardware required is a programmable controller that can be built on a PC-board about 2- x 3-inches (51- x 76-mm.) in size. It uses an 87C751 microcontroller plus a few other components and a keying relay, the contacts of which can be connected to the keying jack of

almost any transceiver. A schematic diagram and complete parts list is included.

The microcontroller must be loaded with software, but the author does not describe it, nor does he make the source code available. Instead, he offers to supply a preprogrammed chip.

The encoder generates code at any desired speed from 4- to 69-words-per-minute (wpm); the default value is 15-wpm. An audio transducer is mounted on the board and supplies a sidetone for monitoring or code-practice use.

Two message buffers are included; one for preloaded messages, such as for calling CQ, and the other to allow typing ahead while in QSOs. Both buffers hold up to twenty-five characters, but typing ahead of the output is limited to no more than twelve characters. When the buffer gets within three characters of full, an LED indicator lights. For smooth transmitting, the author recommends that the operator type at full speed until the LED lights, then wait until the encoder catches up before going on. A hand key or switch be should be wired in parallel with the output contacts, since there is no way that the encoder can be made to hold key-down conditions for tuning, or other purposes.

A PC-board for this project can be obtained from FAR Circuits, 18N640 Field Ct., Dundee, IL 60118-9269 for a price of $5.60, including domestic shipping. The programmed microcontroller is available for $20, including domestic shipping, or $24 outside the USA, from the author at: Ron Alspaugh - W6NKS, Box 1534, Grass Valley, CA 95945.

Title>TA2:The Triple Trickler
Author>Meyer, Mark L. - WU0L
Source>QST Dec 97, pp. 36-38
Abstract>Construction of a switching system to cycle a trickle charger between several batteries to keep them fully charged while they are not being used.

Digest>To keep lead-acid batteries fully charged and ready to go at any time, a trickle charge is necessary. WU0L has three relatively heavy-duty batteries for his rig, his RV and his motorcycle; sometimes many weeks or months pass when one or more of them are not used. In order to avoid the necessity of manually connecting a charger to each at intervals, he designed a simple circuit that automatically cycles a trickle charger onto each of them, in turn.

Although his circuit is built for three outputs, it can be expanded to as many as ten. However, the author warns that if it is used with ten batteries, each will only be charged one-tenth of the time and that may not be sufficient.

His system uses a wall-cube DC power source to provide the charging current at rates up to 0.4-Amps. It should be emphasized that it is to be used only for trickle-charging a battery that is fully charged at the

start. The switching circuit utilizes a 555 timer that issues an output pulse approximately every 13-minutes. That pulse goes to a 4017 decade counter that is wired so that one of its output pins is positive at all times, and it steps from one pin to the next each time a pulse is received. Since he originally designed the switching system for only three batteries, only the first three pins are enabled and after the third position times out, the cycle returns to the first pin.

Each active pin is connected to a power MOSFET that delivers the charge current to its respective battery whenever its input is positive. To add the capacity to handle an additional battery, it is only necessary to add another MOSFET and rearrange a jumper wire that controls the recycling point of the counter.

A PC-board for this project is available from FAR Circuits at the address given in the preceding article, for $5.50 including domestic shipping. A complete circuit diagram and parts list are included in the article.

Title>TA3:An Ultra-Simple Receiver for 6 Meters
Author>Kitchin, Charles - N1TEV
Source>QST Dec 97, pp. 39-41
Abstract>Construction of a super-regenerative receiver for 6-meters.

Digest>This article describes a simple receiver for the 6-meter band that is capable of receiving AM, SSB, FM and CW signals. It can be operated for short periods using only a 9-Volt transistor battery. For long-term use two 6-Volt lantern batteries, in series, will operate it for many months.

It uses a super-regenerative detector with one stage of RF amplification ahead of it, and an IC audio amplifier after it. Tuning is controlled by a 50-pF. variable capacitor. Because it is very sensitive, a gear-reduced dial is strongly recommended. Likewise, the regeneration control is very critical and the author recommends using a 10-turn pot for it. The combination makes the receiver easy to operate. For best performance, the regeneration control should be readjusted each time the tuning is changed.

Construction of the receiver is not difficult, but certain precautions must be followed. It should be built on a single PC-board and it should have a metal front panel. The tuning coil must not be mounted directly on the circuit board; it should be mounted well above the board on some sort of standoff insulators. It must be kept well away from the chassis ground and any other metal parts. If the entire receiver is to be built inside a metal box, it should be thoroughly checked on the bench to be sure oscillation occurs before it is mounted in the box.

A schematic diagram and parts list is included in the article. The author also provides complete instructions for initial tuning and adjustments.

PRODUCT REVIEW (PR)
Conductor: Rick Lindquist - N1RL
Sr. Asst. Technical Editor

Title>PR1:QST Compares - Economy and No-Frills 2-Meter FM Hand-Held Transceivers
Author>Kleinman, Joel - N1BKE
Source>QST Dec 97, pp. 60-68
Abstract>Performance review of 2-meter H-Ts: ADI AT-201, Alinco DJ-190T, Alinco DJ-S11T, ICOM IC-T2A, Kenwood TH-235A, Midland 73-030, and Standard C156A.

Digest>This is a performance review of seven 2-meter H-Ts: the ADI AT-201; the Alinco DJ-190T; the Alinco DJ-S11T; the ICOM IC-T2A; the Kenwood TH-235A; the Midland 73-030; and the Standard C156A. Although they are all single-band FM handhelds, it is not quite correct to call all of them "No-Frills"; some offer a number of features generally seen only in more expensive gear.

The prices really do deserve the appellation "Economy", as the most expensive one of the group has a current street price of about $215. All of them provide memory channels; all provide switchable power outputs; all contain a CTCSS encoder; all are well-built and operate well. They all operate on internal batteries and, in almost all cases, they can also be plugged into a 12-volt DC supply. When operated on external power, they will develop higher RF output.

ADI AT-201
The AT-201 contains 40 memory channels and has a keypad. It performs well and provides a maximum 2.5-watt output when working on internal batteries, which are NiCd. The reviewers found the LCD display to be too small for comfort. A typical selling price is $170.

Alinco DJ-190T
This unit does not contain a keypad; programming the 40 memories requires five different steps, but is not difficult. The LCD display is remarkably large and legible. The rig's maximum output power, on batteries, is 1.5-watts. Standard batteries are NiCd. The current street price is $173.

Alinco DJ-S11T
The DJ-S11T is the smallest of the seven, only about half the size of the largest ones. It can easily slip into a shirt pocket. Unlike all the others, it does not have a "rubber duck" antenna; it uses a fixed telescoping whip.

The maximum power output is only 0.34-watts and the unit operates on three AA batteries. It provides 20 memory channels; programming them is somewhat more complex than with units having keypads. The reviewers found that the limited power prevented them from accessing repeaters

that were more than one mile (1.6-km.) away, which they felt is a severe limitation. The average purchase price is $120.

ICOM IC-T2A
The IC-T2A is rugged and a good performer. The received audio was stronger and clearer than most of the others. It provides 40 memory channels and the keypad is large and easy to operate. The controls can be user-programmed. The power supply is 8 AA NiCd cells instead of the typical monolithic battery pack. The output power is 4-watts while on internal batteries. The reviewers criticized the LCD display as "a bit too small for easy use". The typical selling price is $170.

Kenwood TH-235A
The TH-235A includes a keypad, but has a minimum of other controls. The reviewers found that programming the unit is a pleasure; it was the simplest of all seven to program. The display is too small for some icons to be seen easily. The maximum output power is rated as 1.5-watts, but the reviewed model put out 2.5-watts while using the internal NiCd battery pack. It provides 60 memory channels. A common street price is $173.

Midland 73-030
The Midland unit may be hard to find in US stores. It contains a keypad, has an adequate display, performs well and seems well built. It provides 73 memory channels and uses a NiCd battery pack. The maximum power output is 2.8-watts maximum on battery power. Its street price is $215.

Standard C156A
The C156A is rugged and good looking. It has a keypad and adequate LCD display. Reviewers found it somewhat difficult to program. It provides 100 memory channels and this is the only one in the group that allows a name to be appended to each channel, using up to seven letters for each. It uses four AA batteries for internal power and puts out 1.8-watts. The street selling price is $200.

Title>TC1:Which Solar Activity Measurement Should I Use?
Author>Luetzelschwab, R. Carl - K9LA
Source>QST Dec 97, pp. 71-72
Abstract>To calculate radio propagation with modern software, one should use the smoothed solar flux or sunspot number, not the daily measurements.

Digest>K9LA makes a persuasive case that one cannot expect to have good results in calculating radio propagation characteristics using the value of the K-index or the solar flux number, as observed on the current

day. There is too much variability from hour-to-hour and day-to-day. The proper method of using the available prediction software is to take the smoothed solar flux or smoothed sunspot number, because they were the variables used in developing the ionospheric model upon which the programs depend.

Title>TC2:Chrysler Responds
Author>Gilmore, Bill - WB8FPQ
Source>QST Dec 97, p. 72
Abstract>For electrical safety, mobile equipment should be grounded to body sheet metal, NOT directly to the battery terminal.

Digest>WB8FPQ is a project engineer with the Chrysler Corporation and replies to a question from N8BLK in "The Doctor is IN", QST Aug 97. Contrary to most common beliefs, mobile radio equipment should be grounded to vehicle body sheet metal, NOT directly to the battery terminal. When the equipment is correctly connected, if the battery negative lead opens, the current being supplied by the alternator is safely returned to the engine block; or if the vehicle is off, it cannot draw starter current through any path. That is the only way to ensure a safe condition for all wiring and accessories.

HINTS AND KINKS (HK)
Conductor: Bob Schetgen - KU7G

Title>HK1:Rewinding Relays for 12-Volt Operation
Author>Wade, Paul - N1BWT
Source>QST Dec 97, pp. 69-70
Abstract>How to rewind DC relays to operate on different voltage.

Digest>In hamfest flea markets 24-volt and 48-volt DC relays are relatively common and inexpensive. They can be made much more convenient if they are rewound to operate on 12-volts. The author has derived equations that determine the number of turns and wire size required to make the conversion.

Magnetic force in the relay structure that causes it to operate is determined by the product of current flow times the number of turns of wire in the coil. To make a new winding equivalent to the original, one needs to duplicate the original number of ampere-turns using more amps and fewer turns. But the new coil will have to take up no more space than the original one.

The number of turns of wire that can fit in a given space is inversely proportional to the square of the wire diameter. Also, the resistance of copper wire per foot is inversely proportional to the square of the diameter. And the power that is dissipated in the coil is proportional to the current squared times the resistance. From these three

relationships, the author proves that for any size of wire that fills the bobbin, the same amount of power consumed provides the same number of ampere-turns. From that, the size of wire can be calculated that will draw the proper amount of current at the lower voltage to consume the same number of watts as before.

The standard American Wire Gauge (AWG) numbers are reduced by one for each increase of 1.26:1 in cross-sectional area, so the author shows the following relationships between supply voltage and wire size:

Original Desired Size Change
28-V. 12-V. 4
48-V. 12-V. 6
115-v. 12-V. 10

In other words, if a 48-Volt relay is found to be wound with No. 38 AWG wire, converting it to 12-volts would require wire six gauge numbers heavier, or No. 32. Winding the same bobbin as uniformly and as tightly as possible to fill exactly the same space as the original coil should provide a coil that will work exactly the same on 12-Volts DC as the original did on 48-Volts.

Title>HK2:Paint Spray Heads as Knobs
Author>Joy, Lawrence W. - WN8P
Source>QST Dec 97, p. 70
Abstract>Some small electronic variable components have very small diameter shafts. Control buttons on spray cans can sometimes be used as knobs.

Digest>WN8P needed a replacement knob for a rotary switch and the shaft was too small for any of the knobs in his junk box. He found that a control button from the top of a spray could fit the shaft tightly and it served the purpose very well.

Title>HK3:A Good Sidetone Oscillator
Author>Bramwell, Denton - K7OWJ
Source>QST Dec 97, p. 70
Abstract>For a pleasant tone, build a sine wave audio oscillator using a phase-shift circuit.

Digest>These days, most hams wanting simple audio oscillators would probably build them using digital ICs, such as 555 timers. K7OWI needed one for a CW sidetone application and found that the digital circuits he tried tended toward key clicks, chirps and harsh notes.

He decided that what he needed was a sine-wave oscillator, which he built using a transistor in a phase-shift oscillator circuit. It has worked out well. He has included a schematic diagram and parts list with his letter.

NEW HAM COMPANION

Title>NHC1:The Doctor is IN
Author>Various
Source>QST Dec 97, pp. 49-50
Abstract>Questions and answers on subjects of primary interest to new hams.

Digest>Questions discussed in this issue include: how to measure the impedance of headphones and microphones; MARS frequencies; connecting stereo outputs to monaural inputs; appropriate ground buses; legality of cross-band contacts; incompatible standards for 56-kbps modems; spread-spectrum communication; coherent CW; and others.

Title>NHC2:On the Road - the Joys of HF Mobile
Author>Ford, Steve - WB8IMY
Source>QST Dec 97, pp. 51-54
Abstract>Hams who commute via automobile can take advantage of the driving time for operating amateur radio.

Digest>Many hams, especially those with small children, find that they have very little free time in which to enjoy their hobby. But many of them spend a half hour, or more, commuting to and from work every weekday. WB8IMY relates how he has succeeded in making use of his commuting time to work DX on the HF bands.

He permanently installed an ICOM IC-706 HF transceiver in his automobile and mounted a 20-meter Ham Stick antenna on the trunk lid. He selected the IC-706 because it has a detachable control panel that he has mounted at a convenient place next to the shift lever. It is connected to the main body of the transceiver located in the trunk by a cable that he snaked under the transmission hump between the front seats. The power wiring was fished through the grommeted hole in the fire wall that carries all the car's other electric wiring. He connected it directly to the battery terminals, with fuses inserted in both wires.

Now he enjoys his radio activities at times when he otherwise would have had only the frustrations of commuter traffic to contend with.

Title>NHC3:The Crystal Radio
Author>Evison, Dave - W7DE
Source>QST Dec 97, pp. 56-57
Abstract>Building a crystal radio using modern components.

Digest>If amateur radio is to continue to thrive, clearly more young people must be enticed into it. Many old timers will agree with W7DE when he writes that the best way to interest youngsters is to introduce them to the electronic components and wiring of radios, rather than to treat them as just electrical appliances. Many of the seniors began with crystal radios, and they are still is good vehicles to pique kids' curiosity.

This article provides construction details for a crystal radio. The detector is a 1N34 germanium signal diode, instead of a cats whisker! But the rest of the components would have been familiar to an experimenter in the 1920s. A schematic diagram and full parts list is included, as well as several photographs of the finished item.

Title>NHC4:HF QRP "Foxhunting"
Author>Mugleston, Brad - KB0ROL
Source>QST Dec 97, pp. 58-59
Abstract>Describes a type of radio contests for hams using very low power. They have no relationship to direction-finding "fox hunts".

Digest>Most hams recognize the word: "foxhunting" to mean trying to find a hidden transmitter using radio direction finding. The kind of foxhunting KB0ROL is writing about is not that; he is describing a QRP activity that was initiated by K5FO, the founder of the Internet QRP Club. This club is dedicated to the use of Internet to bring together QRP enthusiasts.

QRP foxhunts are a form of contest similar to "sweepstakes", in which QRP operators try to work as many other similar stations as possible. They occur on Monday through Thursday from October through March on both the General and the Novice/Technician Plus portions of the 40-meter band. Starting frequencies are: 7.040- and 7.110-mHz. for General Class and Technician Class operators, respectively.

Dates and times are posted on the World Wide Web site: http://qrp.cc.nd.edu/QRP-L/index.html. Alternatively, any interested person can get full information via E-mail by subscribing to the QRP-L E-Mail Reflector. All messages sent to the Reflector are automatically routed to everyone on the subscriber list. To become a subscriber, send an E-mail message to: listserve@lehigh.edu. Make the body of the message:
subscribe qrp-l
<your name>
<your call>
Or else, communicate directly on the QRP Club Web site:
http://qrp.cc.nd.edu/QRP-L/index.html

One does not need to become a member of the Internet QRP Club to be a subscriber.

GENERAL INTEREST ARTICLES (GI)

Title>GI1:The Boise River Festival - An Amateur Radio Showcase
Author>Barrett, Tony - N7MTZ and Wade, Steve - KF7YC
Source>QST Dec 97, pp. 28-31
Abstract>Boise, Idaho hams play a vital role in management of a major yearly event that draws many thousands of visitors to the city.

Digest>The Boise River Festival is a yearly event that lasts for three days every June. It brings as many as a million visitors into Boise, Idaho. Traffic control, event scheduling, medical emergencies, and all of the other factors involved in an event that involves such a large number of people, present major problems. But all those problems are ameliorated if there are good and continuous communications throughout the city.

Ham radio operators play a major role in the event and 1997 represents the seventh year it was held. The hams, through experience, have developed their roles to high degrees of efficiency. Hams work in close cooperation with the Boise Police Department and serve as additional eyes and ears when it comes to public safety. They also have become known as Festival Ambassadors who answer questions for the public. If they do not know the answers immediately, they are in continuous radio contact by H-Ts with the people who can answer them.

For the last several years, N7MOE and several others have equipped mobile units with amateur television cameras (ATV). These units give not only verbal reports, but actually transmit surveillance camera scans of any problem areas to monitors in the Police Department Command Center.

These amateur activities not only play a major role in making the festival safe and fun for all, but also bring a great deal of favorable attention to amateur radio as a hobby.

Title>GI2:SAREX - Looking for Tomorrow's Scientists Today
Author>Hollenbeck, Michelle "Missy" D. - AA0OF
Source>QST Dec 97, pp. 42-43
Abstract>A shuttle astronaut communicates with school children.

Digest>In September, 1996, the space shuttle Atlantis was in orbit. One of the astronauts aboard was Jay Apt - N5QWL, and he conducted Shuttle Amateur Radio Experiments (SAREX) during which he communicated with school children via amateur radio. One of the classes that talked with him was at Andover Middle School, Andover, Kansas. During one pass overhead, Apt answered twenty questions by students from an audience of about 200 people gathered in the school cafeteria. Several months later, he visited the school and met face-to-face with many of the pupils he had talked with by radio. This article describes the event. It was written by the teacher who managed the entire meeting, both the original radio contact and also the arrangements for Apt's visit.

Title>GI3:The Digital Audio Radio Service
Author>Kleinschmidt, Kirk A. - NT0Z
Source>QST Dec 97, pp. 44-47
Abstract>Soon satellites will begin broadcasting digital hi-fidelity audio to USA listeners.

Digest>In April, 1997 the U.S. Federal Communications Commission (FCC) issued approvals to two competing companies to establish satellite-based digital audio radio service (DARS). Each will launch a geosynchronous satellite provide CD-quality audio broadcasting beamed to all 50 states of the United States.

Each will broadcast in a 12.5-mHz. portion of the 25-mHz. wide DARS band at 2.320- to 2.345-gHz. With sophisticated compression techniques, each transmitter will be modulated to carry 50 audio channels, 30 of them ultra-high fidelity for music and 20 more with lower fidelity for voice.

For reception, patch antennas about the size of a silver dollar will be used. Because most radio listeners are travelers in vehicles, primary attention in equipment design is being given to mobile receivers. It is projected that the satellites will be launched late-1999 and early-2000. Receivers will be in full production and available to the public at approximately the same time. It is estimated that they will be priced at about $150, each.

Without doubt, there will be amateurs who will experiment with DARS technology for amateur operations. It will be interesting to see what impact they may have in the ham radio of the future.

Title>GI4:Radio Coaches
Author>Gagne, Jennifer - N1TDY
Source>QST Dec 97, p. 48
Abstract>ARRL plans how hams can cooperate with a Federal program to mentor children and adolescents in the amateur radio hobby.

Digest>Earlier this year Presidents Clinton and Bush, along with other prominent political, business and professional leaders held a conference and created a multi-year campaign to be called: "America's Promise, the Alliance for Youth". The program seeks commitments from people across the country to help insure that young people have access to five critical resources:

1. Ongoing relationship with caring adults.
2. Safe places and structured activities during nonschool hours for learning and growing.
3. A healthy start through proper medical care.
4. Marketable skills through effective education.
5. Opportunities to serve their local communities.

In response to the call, the ARRL Board of Directors created a "Radio Coaches" program to encourage amateurs' involvement in youth activities. The ARRL is asking all its Affiliated and Special Service clubs to form a "Coaching Team" that will build a relationship with a school, community organization or other institution. Acting in a manner analogous to coaches of athletic teams, they will coach young people on the elements of electronics and the magic of radio communication through ham radio. The ARRL will supply recommended plans and other information to try to maximize the effects of these activities.

For more information, contact the ARRL Field Service Department via
E-Mail: coaches@arrl.org.

You know, the above mind-set typifies those who claim we need "quality, not quantity" as far as hams go. What they really mean is that they don't have any use for hams who aren't like themselves. Too much of their sense of self-worth is wrapped up in whatever skill or trait they have that makes them feel superior to their brother amateurs. So much for tolerance!

What is wrong with an amateur who likes to communicate for fun, maybe doesn't have a technical background, and who isn't a "dedicated" communicator? Nothing, that's what. That probably describes most amateurs. It sure as hell describes me. Amateur radio is my lifelong hobby, but hey, it is a hobby. You don't have to be an electrical engineer to be an amateur, and you shouldn't have to be. It is a hobby, not a calling.

Nope. But so what? Morse Code is strictly a recreational
mode, mainly for elderly hams. No reason to require busy
working people who have already passed their Morse test to
get their general, advanced, or extra class to waste their
time re-honing a recreational skill for which they have no
use or interest.

Why? Why do we need these things? When I look at most of
the questions in the pool, I mainly see things that I
learned strictly for passing the test. Not things that I
use being a radio amateur. All that crap about figuring out
impedence, and those other formulas. I passed 'em all, back
in the days of FCC testing (except for the extra: took it in
'92) ... utterly useless. (I rarely have met any amateur
who ever used any of that crap). The stuff that I have
really used, such as RFI abatement techniques via toroids,
grounding of the station for safety, etc., is conspicuously
absent from the tests. Exception: regulation stuff like
band limits, power limits, etc.

Most amateurs learn what they need in order to be good
amateurs not from the tests, but from their experience as
amateurs. Same as in many professions, such as law or
finance (my two callings). Re-testing is a half-baked, even
a crackpot notion. Its consequence would be the demise of
the hobby. Don't think so? Just look at the effect
incentive licensing had. Re-testing would take the
incentive licensing idiocy (almost everyone agrees that is
what it was) to its extreme. It would kill the hobby dead.

What really gets me is that you people would impose this
burden on hundreds of thousands of amateurs without any real
showing that there is a "harm" that needs to be
"corrected." You would just do it because it seems like a
good idea, maybe over your evening cocktails. Well, that's
in the best spirit of Big Government. Thank God none of you
is in any kind of position of power over your fellows, or
ever likely to be.

I am sure Pro-CWers suggest school kids to learn abacus and
use this old obselete "mode" which requires a lot of effort for some
people instead of plug 'n play calculator.

Abacus features:

- Requires practise to use it
- Old mode. More than 1000 years old.
- Very slow.
- Inaccurate
- Can be used during the Emergency because it doesn't use any
batteries (so what ?)

If you really force school kids to learn Abacus, you must be
really silly. (don't take me wrong. I know abacus and I
sometimes use its method when I calculate something in my head.
I always complain something after I try it... I have a qualification
that qualifies 10 9-11 x 25 digits +/- calculations within 10
minutes, 20 6-7 & 6-7 x or / calculations within 10 minutes and
more...)

This is very similar to CW/No-CW debate. CW requires practise, old
mode, relatively very slow, inaccurate and "could" be (?) used during
the emergency... but if you really think CW is heaven and does
everything, you are deadend.

Be a pro-abacus and many don't care.
Be a pro-CW and many don't care.

What's funny, Bill, is the other day I said, "Handle here is Cecil" just like I have been saying for 46 years. The guy came back and said, "We hams don't use that CB-type lingo. How long have you been a ham?" I replied, "Since before the 11m CB band existed". Most younger hams don't realize that the CBers picked up their lingo from the other services, including a lot from hams just like us. It's just one more way that ham radio reminds me of a religion which includes the Morse code ritual, the CBer scapegoat, the commoners (techs) and the high priests (extras), and the attacks upon anyone rational enough to point out their silliness.

In the time when one had to *learn* to pass the test instead of the
current memory exercise, that was true. Today, no. The code test *is*
the only remaining true qualification, and is likely to remain so for
the time it remains.

>This doesn't really answer the question about hams, because I don't know
>the situation. I realize in this situation how nice it would have been to
>have a 2m rig.

that's the thing. most of the traffics (emergency included) are
passed on 2m (or 440 repeaters...) not 30m CW or something.
You will be alone if you don't have a voice VHF rig.

Believe me. If you listened to some of the repeaters, most of the
emergency traffics are handled by no coders. (majority of VHF and
UHF rigs are owned by no coders ?)
Many coders tried to chit chat on the repeaters just like as they do
on CW or something and they were kicked off.

Visit this excellent site
why code has no importance to the amateur radio today:

I'm probably going to buy the new icom scanner IC-PCR1000!

Did anyone test it?
How is it?
Is it better than the IC-R10?

Thanks!

You know Dick the pro-code-test crowd keeps beating this memorization nonsense into the ground. Most people, non technical included, find it easier to just learn the material.

My wife recently got her ticket and starting off she had question pools flash cards etc. and after a day or so she came to me and said, "I'm not going to memorize all this, teach me what it means." So we entered a learning phase and she went on to perfect scores on all the written tests she took. Her comment after testing, "I don't see why or how anyone could memorize all those questions." Naturally there are things you have to memorize like band edges and rules but it much easier just to memorize the information rather than a large number of questions.

Now I realize that this is not a statistical sample but I did find it interesting that a totally non technical person prefered to learn the material rather than memorize hundreds of questions.

REPLY...

It does not fit because you ignored the key word, "unnecessary."
Radio theory (rules, safety, etc.) are necessary. Testing for knowledge
of CW is not.

>program of forced Morse learning/testing, of course) should have no problem
>in "putting their money where their mouths are" if the money was earmarked
>for FCC enforcement in the ham bands ...

We realize that you have NOT submitted anything to the FCC. You never will.
I don't have a problem with paying a yearly fee for a license. I don't think
$100 is enuff. $100 is a mediocre dinner where I live. I think $1000 would get
rid of more of the dead wood. If you'd like to donate $1000 to the FCC for
enforcement, I'll be glad to match it. Which reminds me, I haven't received a
bill from your shrink yet.

>Seems that the pro-code crowd has a problem both with "dedication" AND
>with the idea that there might be some REAL enforcement of the rules.
>(This seems to correlate with the fact that, by far, most NALs are issued
>to coded hams with "higher" class licenses.)

Amazing how easily you confuse yourself, Squiggy. 'Problem with dedication'. I would think that anybody who doesn't have two weeks to learn Morse code fits more into that catagory. Turn the church sermon into the no code debate, like usual. Maybe you can explain to us why most people who don't have a drivers license never get speeding tickets.....

A Sign of the Times and indeed the No-Code philosophy--He has already forgotten he has a brain to do basic math with, if he ever knew. Quite likely he wasn't "required" to learn such mundane things as the multiplication tables and long division--That's where we are in education today, but no matter, an electronic calculator will save the day! Technology to the Rescue, Forever!
Wonder if it's stuck to his butt, he sure wouldn't want to lose it.

And if you are VERY lucky the ham in the other car will actually be able to know cw and copy what you send. On the other hand he may think you are honking at him for other reasons and take a shot at you.....

If some have their way you will just have to start holding up a poster with your message on it. Of course that will not last very long because after they get rid of the cw requirement they will start whining that it is too hard to read .....

a couple of friends were having a contest guessing what abrieviations stand for. like nbc,cbs,fox. well i asked what "ham" was. one guy said it was a cut from a pig.
well, that made me think about the comparison between "hams" and pigs. pigs as a whole are very lovable. they only require lots of food, a cool place to relax, and plenty of attention when other animals are around. in fact if a pig see's that he is not the center of attention, he will start making loud & annoying noises.
a week ago, i went to a ham club meeting with a "ham" that is helping me with my code practice. there was lots of food with plenty of club members gathered around filling their plates. As a matter of fact, the table was so crowded, i had to force my way in to get a drink.
After everyone cleaned the tables off, the talking started. well the guy at the podium did the least of the chatter, with everyone talking over him to make their point. it dint take long for the noise to get loud and annoying.
OH YEA, one more point. the heat wasn't working too good, so everyone was complaining about the cold. chock one up for the "hams".

rogerjb@ibm.net waved his store-bought callsign and wrote:

> .... as in many professions, such as law or finance (my two callings).

The May Day parade in Moscow is the largest, most important military parade of the year. In the early 90's parade, Yeltsin and Gorbachev invited Ronnie Reagan to come watch it with them.

The parade commenced with a battalion of tanks, followed by a division of infantry, followed by armored personnel carriers and mobile artillery. They had mobile ballistic missile launchers, electronic jamming vehicles, and throughout the entire time the formations were overflown by squadrons of the most advanced interceptors, fighters, and long-range tactical and strategic bombers. Reagan, who had never been this close to war in his life, except in the movies, was suitably impressed.

Then he noticed that, way back at the end of the parade, there was a disorganized, messy bunch of men in rumpled suits tagging along behind the last artillery pieces. "Who are they?" he asked.

"Ah," said Yeltsin, "those are our lawyers and economists!"

"But I thought this parade was military..." said Ronnie, confused.

"Mr. Reagan," said Gorbachev, "have you SEEN the damage those men can do?"

1432. GMRS HTs for TRADE

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-15 00:00:00 UTC
From: Will White <will.white@asu.edu>
Message-ID: <34BE8191.17F1@asu.edu>
Source record: 181441

I have a pair of Radio Shack PRS-101 ten channel GMRS transceivers I
want to trade
for one of the items listed below. The radios are hardly used, 10-10,
and come with
AC adapters/battery chargers. Output is switchable, .09 and 2 watts.
Speaker-mic/Headset
jack. I will trade the above, originally $179.00 each, for
one of the following, in good condition:

1) A 9600-baud TNC that will work with a Mac OR
2) A Ranger 2950 OR
3) A Yaesu VX-1R OR
4) A 6M mobile, especially Yaesu FT-690 OR
5) An Index Labs QRP+ transceiver

All inquiries via email please. Thanks

>>>
>>> I would like to enable the full 27 mhz band on a ts 830s. If anyone can
>>> advise how, would be grateful.
>>>
>>> Regards
>>> Andrew.
>>>

I'm gonna address this post right back to the original poster. Andrew, I notice that you did not ask the other three questions that would have to be addressed before I would consider showing you the mod you are asking for:

1 how to reduce power to below 4 watts

The legal max output on AM CB is 4 watts. Your superior modulation and a good antenna/ground system will make your rig sound far more powerful tnan the guys with a stick stuck on thier pickup truck mirror. You definitely need to run modest power output. There are so many users of the CB bands that you will be sure to be interfeing with somebody when running a strong signal. Not only will drawing attention to you increase the risk of you getting caught, but you will be interfering with other stations that you cannot even hear, so the common courtesy of listening first before transmitting won't be sufficient. Reduce your power output to a watt or 2 first before asking for the frequency mod.

2 Output filtering

The output filtering on your rig is optimized for the ham bands. You need to get yourself a nice PI network tuner to those harmonics off, and know somebody with a scope to check your output.

3 Responsible operating.

I would have to see evidence that you are a skilled and responsible operator before turning you loose on CB with a rig capable of runnong 100 watts, tuning out-of-band- split, and off- frequency. I would have to be convinced that you are concerned enough about the quality of your signal to learn about spectral purity and how to test your output with o-scope, spectrum analyzer, etc. I would have to be convinced that you would never, for any reason, operate in a discourteous manner or with poor technique.

I will give you a hint. If you study RF design for a few months, you might be able to figure it out from your schematic. If you find it on your own, I guess you will have earned the right. If not, it is irrelevant... nobody can stop you from modifying your radio... only using it in an illegal manner.

Even with good operating practices, legal output, etc, you still can't legally use your rig on CB mainly becaise it has the capability to tune off-frequency.

OK, so where does that leave us? Well, Andrew, you still have yourself a nice ham rig there, and there is one thing you canuse it for legally besides just SWLing.... working other hams using your own callsign issued by the FCC.

Getting licensed is not such a big deal. 6 year old kids have earned ham tickets! There are deaf hams, blind hams, paraplegic hams, hams with learning disorders, all with one thing in common: an "I think I can" attitude. All you need to heat up a wire with that rig of yours is a Novice License. One simple little written exam, a 5 WPM morse exam, and that's it! The questions and answers are published, wo you can test yourself before you take the exam. If you can answer the questions on your own, you can do it at the exam session. 5 WPM code is also a no-brainer. Download SUPERMORSE 4.16 from my web page:

http://members.aol.com/RCrusoe/ab5vh.index.html

and i guarantee you will be doing 5 WPM plus in a week or two if you work out 2 or 3 times a day for 10 minutes a stretch. Read the doc files and you will learn all there is to know about learning the code.

I'll make you a deal... give me your Novice, Tech Plus, or General callsign, and I'll tell you a little bit more about what you're looking for.

Radio Shack usually carries "Now You're Talking!", which is the study guide for the Novice and both Technician licenses. Crack that book, and take it one comfortable bite at a time. The book is not full of techno-babble and is long on explaining concepts that the aspirng ham may have trouble with. Not only does the book prepate you for your exam, but it also goes into station setup, buying or otherwise acquiring gear, legal requirements, effective, responsible, and considerate operating techniques, and really just about everything the new ham needs to get on the air where the REAL learning starts.

If you decide to go for your license, and you bought the book or some other study guide, and you have downloaded SUPERMORSE, give me an e-mail shout if you need any help at all. If you decide "Naaaahhh!" well, I understand. Just realize that for most new hams with HF priveleges, the biggest hurdle to getting on the air is a rig, and you have one that most new hams would trade their teeth for. Shame to just use it for bootlegging!

Good luck, Andrew, and please think about this.

>to organize these newcomers politically and use their newfound strength to
>lobby for retention of the current allocations.

I.... I.... I sense deja-vu. Am I reading a message from the mid-80's. I
could swear this is an argument for the creation of the codeless tech
license. Yes, yes, that's it... The no-code license. It is going to save
amateur radio. And here is why... <insert above quoted text here>

>2) Keep discouraging newcomers, keep the code, watch the numbers of licensees
>continue to stagnate or drop

"continue" implies an action which is already or is currently happening.
The number of new hams, in ALL license classes (http://www.speroni.com/FCC)
have *increased* continuously every year. 30K new hams last year, in all
license categories!

Sorry, but the "number of licensees" is not dropping or stagnating. Only
in your dreams.

So you can be the first one on your block to know:

In the early days of Amateur Radio, before people were assigned calls
and merely made one up there were 3 young men that put together a
station.
They must have been quiet active as when they quit using a combination
of their last names, one started with H; one started with A; and the
other
started with M and abbreviated it to HAM, the word HAM became associated
with Amateur Radio.

On/Off Keying. The term is seldom used these days since practically all morse
code is in fact OOK. There have been other modes in the pastusing Morse.
FSK, Frequency Shift Keying telegraphy is one.

OOK is more all-encompassing than the term CW. For instance, OOK would include
MCW, Modulated CW which is receivble by ordinary AM mode receivers. Basically
any mmode involving turning something on and off to transmit Morse Code signals
is OOK

I'm really sorry you feel this way about the code. Obviously your opinion is not shared by the majority of HAMS. As for me? Ham Radio ain't golf and country clubs and no code weenies ain't Tiger Woods. Just because something you desire requires hard work and is not easy, that does not mean it is discriminatory. That's just your twisted spin on it.

As for the $100.00 annual fee, man..... Thank God you don't hold public office.

fake name with no call sign.

I wasn't aware that a callsign was required in order to use a computer, access
the Internet, or post a message on USENET. When was that law enacted?

How about settling things once and for all...convince us that we're wrong
in our assumptions.

You've done nothing so far except make fatuous remarks.

Re-testing will never materialize without a fight and the ARRL
putting the proper "spin" on the issue, should it even become an NPR. The
ARRL stands to lose a lot more in the way of "memberships" and, more
importantly, power.

Roger, you bring up some good pointsabout the conduct on the ham bands and the policing of the bands..FCC has taken a "hands off" approach to most of theham related problems,ARRL has been sued or threatened suit for advising someone of their infractions, if you as an individual reprimand someone, thats just what most of them want, a hassle..probably what we need to do is get a serious movement going in the radio clubs and other organized groups to have a trained and knowledgeable committee to work on this at the local level. What do you think? Harold W4PQW

Take the out-put of the interfered - with radio(audio), and plug it into your stereo. Put at least (1) speaker against the wall, facing the neighbor. When the next call is placed, CRANK UP THE VOLUME.

Deny everything when they come to your door.

After a few times they will stop using that 'phone, and it won't cost you anything!

Your Welcome,

K&#65533;MB

The battery pack is about the same size as the small radio. But the big problem is the cost. If I understood their web site data correctly, the battery pack costs MORE than the radio.
Very nice looking little unit, though. I'm looking forward to seeing it in a dealer's showroom in February.

My HTX 202 has performed under very tough conditions for over 4 years now, flawlessly.
There seemed to be a group of them however, roughly two to three years ago that had some serious problems with the finals and bias.Also some modulation problems were reported.
I think when they tried to speed up production to meet demand, quality control went out the window.
On the subject of intermod, I have found the HTX 202 superior to most portables. If you modify them for wide band receive however, there are serious problems with rejection.
Just remember it is a portable, and any comparison must be with other portables.

Just my thoughts.

Please help. I am trying to decide whether to buy a Kenwood AT-50 auto antenna tuner or a MFJ 989 tuner. I'm using a Kenwood TS-50 and an Outbacker Perth Plus antenna. I live on the ground floor of a two-story apartment complex and have no real way to ground the antenna I'm using, so a tuner is about my only option. Anyone with experience using either of these tuners or the Outbacker Perth Plus antenna that could help me out would be appreciated.

>Abacus features:
>
> - Requires practise to use it
> - Old mode. More than 1000 years old.
> - Very slow.
> - Inaccurate
> - Can be used during the Emergency because it doesn't use any batteries
(so what?)

There is nothing inaccurate about the abacus. Just as there is nothing inaccurate about long division, or multiplication tables. Technology fails. We tend to forget that. Packet is certainly more contemporary than CW, but in the event of a technology failure, CW can be improvised, and communication continued, packet cannot.

Isaac Asimov wrote a story years ago about a social order that was so used to technology, that everyone carried a personal computer with them that was interfaced, wirelessly, to a humongous, common mainframe. This, by the way, was years before Newton or Thinkpad, and even before the Bowmar Brain. But the story was that the computers upon which everone depended, suddenly failed. All of them everywhere. Improbable, true. But the point is, that no one was prepared to carry on without them. Because all other modes of processing data, and at that time the major use of computers was mathematical, so no one knew things like long division. It was a humorous exercise getting back to a functioning social order again, and also a very clear message was presented. Old, obsolete, is not necessarily bad.

If lightning, or heaven forfend, a sudden EMP from a weapon should strike our solid state, microchip based digital culture, who would be prepared with vacuum tube technology to continue at least a portion of our technological operations so that the social order can be maintained? Not many. And true, Hams have a reputation these days of being trapped in the past. But think about this realistically, and you'll realize that when technology fails, the only people ready to act will be those whose understanding includes the old, the obsolete, and the simpler levels of technology, to continue, at reduced speed certainly, but to continue. Such has been the service of the ham from the inception of the Amateur radio hobby.

As for the code requirement? Look at it as the secret handshake to get into the club. Its easy to learn, but it does take some effort. And let's get real here, if you can learn the complex subtleties of digital transmission and encryption, don't tell me you can't learn CW code. Its that you choose not to. Hey, its required to get into the club. Its another level of accomplishment. Its another notch in your belt of communication skills mastered. How the hell can that be a BAD thing?

Obsolete? Yeah probably. Slow? Maybe. Like the abacus, it depends on the operator. (And I can find at least two abacus operators who can produce faster results than I can with my calculator. That's a matter of commitment.) Old? Sure it is. So is The Bible. But that used to be called, "standing the test of time," Again, when did this become a bad thing? But given the state of the thinking in this country, I suppose even The Bible is considered obsolete these days. It certainly is clear that many don't care about that, either.

1469. Antenna in Japan for BBC SW...?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-15 00:00:00 UTC
From: groveti@bigfoot.com
Message-ID: <B0E3FA789668178B0C@0.0.0.0>
Source record: 181539

I'm using a Sony SW-100 with its stock 6-meter line antenna joined (not coupled) to a 10-metre length of standard PVC-covered antenna wire. I'm on the top (5th) floor of apartments facing south-south-east, and I've run the antenna vertically 3 meters, then 7 metres along the top rail of a fence made of 13mm/half-inch mild-steel bars (i.e., many verticals + two horizontal rails).

Reception is pretty poor, but I can't make any major changes in the layout except use my 7-metre long balcony (same fence design).Like the roof fence, it faces towards Hong Kong and Singapore, the major BBC relay stations around here

Any suggestions? The Sony antenna tuner/amp AN2 made no difference. Would dropping a vertical wire (max. 6 meters) be better? Insulation from the fence?I've thought about cutting the roof fence from earth with insulators so I have a 7m x 1.7m mild steel array, but I think the Apartment Police would object...

Trying to change the subject of your racism aren't you?

No. I'm trying to get you to show proof of what you claim. To show proof of your accusations. Hey, I'm not gonna argue about your conclusion. Like I said before, you got me. I'm Drew from Florida or whoever you say I am. But let's see some substantiating evidence on how you arrived at this conclusion. You stated that I had posted that I live in Kansas. Upon forcing you to repost that to which you (erroneously) referred, I have proven that I did not make any such statement. I win round one.

>How about
>answering why your racist posts appear on ks.misc and not on
>any other state's newsgroup?

Gee, Tommy. There could be lots of reasons. Relatives in Wichita, perhaps? Friends? Business acquaintences? Perhaps I visited there and found the city a little too...uh, "ethnic" for my personal tastes. By the way, Tommy, your opinion that my post was "racist" is simply that...your opinion.

>How come you're so knowledgeable about
>Orlando being a "crime mecca" which, in another post, also happened to
>be on ks.misc and nowhere else?

Okay...if you insist. Since you obviously have way too much time on your hands, go ahead and post this one (I'm sure you've saved it on your hard drive because it means so much to you), and we'll go through this nonsense all over again.

>Proof you say? Proof can be interpreted in
>different ways depending on the
>context in which it is presented, just as I
>have done. So how about
>convincing me otherwise?

Doesn't work that way, Tommy. In this country, an individual is innocent until proven guilty. Not the other way around, as you have suggested should be the case here. I would also suggest that you obtain legally-permissable evidence before making accusations against someone, as you have done. If Drew from Florida were to see these posts of yours, he may well have grounds for a libel or defamation suit against you.

Of course not. You'll be dead by then. Typical selfish thinking. This is the same type of logic employed by today's retirees who refuse to give up even a small fraction of their Social Security benefits in order to keep the system solvent for the very people who are now paying for their retirement via increasingly-high payroll taxes on their earnings. "Hey, I've got mine, the hell with you."

Lawyers should know better than to quote anecdotal evidence as
statistical "proof".

But then again, lawyers are known for twisting facts into lies.

Maybe if you took your radio outside the rest home and hooked up an
antenna you'd actually find some other people to work.

�WANTED�
HOME MAILERS
EARN $1,000�S MONTHLY
NO ADVERTISING NECESSARY
ALL NEW! �MULTI-INCOME PROGRAM�
How would you like to pay off your debts and have more money to spend? Here is your chance to earn that extra income FROM THE COMFORT OF YOUR HOME and buy ALL the things you have always wanted. Many people, like yourself, are already participating in our newly copyrighted �MULTI-INCOME PROGRAM� and earn extra income each and every week. The work you will be doing is SIMPLE and PLEASANT. No previous experience necessary, your location, age, education or sex does not matter. This simple and pleasant work can be done by ABSOLUTELY ANYONE. We only require that you are honest, reliable and sincerely interest in earning extra money. If this applies to you, then we are ready to show you exactly how. The amount of money you can earn will depend entirely on your own ambition, ability, determination and desire to be successful.
HOW OUR �MULTI-INCOME PROGRAM� WORKS!!
RECEIVE 50% COMMISSION FROM SALES OF UP TO $599.00 EACH!!
The work consists of addressing our supplied super pulling mailing brochures by affixing the supplied computerized peel and stick name labels onto them and applying postage. WE SUPPLY YOU WITH ALL PRINTED MATERIAL. . . the self mailing brochures and computerized peel and stick name labels of people who have requested our various mailing lists offers and/or business progams and books. Our name appears on the printed self mailing brochures. You will never mail anything OBJECTIONABLE OR PORNOGRAPHIC. You will receive 50% commission (half) from orders of $39.00 up to $599.00 each for orders from our MULTI-INCOME PROGRAM. The mailing pieces you mail out will have your own special code number. Your commission checks will be sent to you every time we get an order back with your code number. We send you the actual order coupons from your customers with your code number so you can have an absolute fool proof assurance that you are being paid all your commissions. We pay 100% of your gross profits to you without fail, without deductions, reserves or holdbacks. We collect all bad checks at no cost to you. We also honor all refunds. You won�t ever need a business name, checking account, address, phone, stationary - nothing. Since our name appears on the printed self mailing brochures with your code number, you can simply go about your business in complete privacy. Also, NO ADVERTISEMENTS TO PLACE. . . .EVER. Just follow our simple instructions as outlined above and drop the finished pieces in your local mailbox. IT�S THAT SIMPLE!
RECEIVE DOUBLE COMMISSIONS!!
Now with our newly copyrighted �MULTI-INCOME PROGRAM� you can earn money two ways. Not only will you receive commissions of 50% as stated above, we also

have a built in super pulling second offer in our self mailing brochures that pays you an extra $20.00 commission on every $30.00 order that we get back from your coded mailings. (THAT�S 200% PROFIT ON EACH ORDER!!).

START IMMEDIATELY

Getting started is easy. Simply fill out the application form included and mail it along with your membership fee of $39.00 and your request for supplies. This makes you a commission mailer in our unique �MULTI-INCOME PROGRAM�. This fee pays fo r your membership and starting kit of supplies of 100 mailing brochures and 100 computerized names on peel and stick labels. Just drop the finished pieces in your local mailbox. Remember, you only have to do as much work as you want to. You can work full time, part time, or put in the hours of your choice and your possible earnings can be UNLIMITED! There are no quotas or contracts to sign, so you can stop anytime you want. As your coded order comes back to us, you will receive your commission checks as outlined above for each order we receive back with your code number.

DON�T BE FOOLED!!

There are many fraudulent chain letter, pyramid operations and �GET-RICH-QUICK SCHEMES� being sold today. We recommend that you avoid them. Why fool with some questionable scheme, when our program enables you to earn so much more money LEGALLY!! This is not an offer of employment. What we are offering is a LEGAL business opportunity for you to become an independent commission mailer for our association. This is a proven, down-to-earth program for making money at home and we get the circu lation of our various mailing list offers and business programs into the hands of people who have requested them. REMEMBER: Unlike others, WE SUPPLY EVERYTHING NEEDED TO GET STARTED. . . ALL PRINTED MATERIALS!

DOUBLE IRON CLAD GUARANTEE!!

WE SUPPLY EVERYTHING NEEDED TO GET STARTED as a commission mailer and we mean EVERYTHING. . . .the self mailing brochures and the computerized peel and stick name and address labels to affix to the finished pieces. Our guarantee simply means that after three months you find that you did not recover at least the cost of your initial starters kit that you mail out according to our instructions, we will supply you FREE OF CHARGE - DOUBLE your initial order of supplies. This IRON-CLAD GUARANTEE is good for a full three months. The acceptance of your order by us constitutes our written guarantee as specified above.

FREE TRIPLE BONUS!! (Reg $50.00 Value)

For those people who order from this ad only, we will include ABSOLUTELY FREE our new directory of over 150 National firms in constant need of independent homeworkers. Many of these firms offer earnings of up to $4.00 each for securing and stuffing sales letters into pre-stamped addressed envelopes with FREE supplies included as per their instructions. Others offer top payment for addressing envelopes, mailing letters, assembling catalogs, typing labels, etc. (Nationally advertised as a $15.00 value). ALSO FREE! With your permission we will include your name and address in our computer listing service that goes out to hundreds of national firms seeking homeworkers. In a few weeks your mail box will be flooded with all kinds of home work offers. (Reg. $15.00 value). Also FREE our new mailing list dealership which pays you 50% commission from sales up

to $400.00.(REG. $20.00 value). All three of these bonuses are yours free just for ordering our MULTI-INCOME PROGRAM TODAY!
DOUBLE GUARANTEE APPLICATION FORM!!!

How about settling things once
>and for all...convince us that we're wrong
in our assumptions.

Gee, do I have to repeat EVERYTHING for you, Tommy? Once again (and my apologies for the redundancy here to everyone else), our system of justice provides that a defendent is INNOCENT until proven GUILTY. The burden of proof is on YOU to PROVE that I am who you say I am. Not the other way around. So far, you have failed to do that. When I bring this to your attention, you respond by changing the subject, making unsubstantiated assumptions, or similar nonsense. Care to try again?

Carl, Carl, Carl....

If you are going to try to debate with me, you should first determine
my position is on the issue you wish to debate. You have assumed
that I favor Morse testing, and by some extension of that assumption
you conclude that I am a bigot.

Your assumption, and the insulting conclusion you reach, are not
supported by facts.

The bottom line is that there are no longer enough "pure" hams (as Michael puts it) who are into amateur radio specifically for the technical aspects. There are no longer enough of these types active on the bands to justify retention of the current (large) amount of spectrum space that is allocated to the amateur radio service. So, as Congress begins to bow down to their campaign coffers and look for spectrum to reallocate, amateurs have two options:

1) Invite newcomers, lessen and then drop the Morse requiremen (immediately to 5WPM or less for all classes of license, then remove when the ITU allows), and try like hell to get as many fresh voices on-the-air as possible. Then attempt to organize these newcomers politically and use their newfound strength to lobby for retention of the current allocations.

or

2) Keep discouraging newcomers, keep the code, watch the numbers of licensees continue to stagnate or drop (except for the no-code Tech class), and face the inevitable political reality of having more and more taken away from the amateur service by a Congre$$ who is only too willing to do so.

Those are the two choices. Which one do you prefer?

You're right, it's not a statistical sample, and I'd be extremely doubtful if your wife would withstand any serious technical challenge of her knowledge.

This is beginning to get seriously repetitous, but in the 8 years that I served as a VE administering tests, I found extremely few applicants who had, starting from scratch, gained any serious amount of real technical knowledge from studying for the tests, such that they were able to even converse intelligently on the subjects over which they had just been tested. Certainly they were rarely able to apply much of their learning to their stations. Those applicants who had prior technical knowledge are a different matter.

For beginning hams, this is normal, no one starts anything with experience, that is gained through continuing study, learning by doing, and work toward advancment. Our hobby is loaded with people who have never cracked a book, nor touched a key after passing their tests. So many newcomers just buy a radio/HT and from then on it's all talk. I gather that you consider this to be "OK", after all the test has been passed, what else should anyone expect, right?

Please help me with the following problem:

I have come into possesion of HT Alinco DJ180, but the problem is that
the only thing that is shown on the display is: Ch and the number of the channel
i tried to RESET it but apparently no effect.!!

I guess that someone has Jumpered something inside radio thus preventing
outside modification.! ?

Please help if you know WHAt and WHERE to CUT

Thanx.

Have you ever seen a regulated plate supply in *any* vacuum tube amplifier? The maggie usually acts as the second half of a voltage doubler circuit. The doubler capacitor acts as a smoothing filter for the 120 Hz AC. There may be some residual "hum" on the FM signal, but that's easily filtered out at the receiver.

1498. "Local" Communication, 10m, 6m, 2m, 220

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-15 00:00:00 UTC
From: Jiann-Ming Su <js290@prism.gatech.edu>
Message-ID: <34BE4968.7960@prism.gatech.edu>
Source record: 181568
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.antenna

I am looking for advice, suggestions and experience with local communications (mainly within 25 mile radius but also as much as a 250 mile radius). I am looking for information on the different performance characteristics of the amateur bands and modes to use within these ranges. I am trying to learn something and also create my ï¿½master planï¿½ :) for equipment purchases where I can concentrate my limited resources. , anyway, you get the idea...

I currently use 2m and some 440 for my around town communications. My parents live on a farm in the North Georgia mountains and I love to experiment with communication systems in that environment. My experience so far says that 440 is basically useless (one mile and a few bends in the road and 440 is unreadable but 2m is 5-9+) 2m gives reasonable propagation, but even then we sometimes have trouble getting 8 miles as the crow flies simplex with 100w, a 7db antenna about 60ft up, but in other directions we can communication 100 miles under the right conditions. So the location is not the best, but that just gives more challenges! I also use the crossband repeat mode when I go hiking 440-2m but once again 440 has at most a one mile range HT to mobile. So it is not very useful for anything more than a walk in a city park, but the wilderness areas up there are quite large! I have also experimented with 2m and 440 in large buildings, ie a mall and the World Congress Center in Atlanta. Even there (where I thought 440 would show itï¿½s stuff) the 440 would unreadable but 2m had a 5-5 signal.
Conclusion: 440 simplex is useful for only very limited distances and 2m has several times the range.

With that in mind, how do the other bands measure up?
10m FM, 6M, 2m, 220, 440 and 1.2G
Does 220 have characteristics like 440 or 2m (unfortunately I donï¿½t think there are any 220 dual band HTs) Would 220 be a better band if I want longer distance and in a mountainous area?
What about 6m or 10m FM? If I wanted to crossband when I hike, back to my car and then out on 2m, would 6m give me a reasonable range or even 10m FM? (I have been very unimpressed by CB performance though, I donï¿½t know if it was the band or the mode)
What about mobile to base SSB? I have tried different bands on HF (with a very suspect antenna contraption on my car) but even with 100w the performance wasnï¿½t much better than CB and 2m FM was 100 times better (there were some kinks, i.e. polarization and a home-brew mobile antenna)

Conclusion:
1. I would like to hear from people who use bands other than 2m and

440, who can comment and contrast their performance to those bands, especially in mountainous areas. using both mobile, HT or a combination. There must be some good reason why you put up or use a repeater other than 2m or 440!
2. Also some idea from people who are in similar situations and what kind of system they use.
3. People who can give some tip on SSB HF for ï¿½localï¿½ communications and ï¿½near angleï¿½ or ï¿½vertical angleï¿½ (I think) propagation modes. (they need to be as ï¿½localï¿½ <500 miles as possible, when I was in Ecuador I was always irritated by the US hams (especially on 80m) who would ragchew with someone across town for hours about their new 500w amp they were using and they were 5-9+30 overseas and totally oblivious)
3. I would be nice to not just have anecdotal stories, but halfway designed experiments or some theory or just pointing me to some sources, books, or places to post, because obviously the land mobile and police have done such studies.
4. Suggestions on antenna designs. vertical, horizontal, or cross polarization, endfed compared to centerfed stacked dipoles. I am generally more interested in area coverage compared to point to point, and working simplex or hitting a repeater mobile than hitting a repeater from home.

Sorry for the long post, but hopefully this will start up a good discussion.

Hallo to you,
I would like to know what kind of sound blaster are you using with
>SUCCESS< with the KW5Q's SBFFT v1,2 DSP filter program.
I have tried 5 (five): 2 Creative 16, 1 OPTI 931, 1 Audio Excel, 1
Avance Logic 100.
Only one of the 2 Creative SB16s works with some reluctances only
under win95, the others are practically muted or no load at all the
sbfft v1,2 program.

I would appreciate any good comment or idea.
Of course I have tried almost all irq\dma combinations.

I will talk real slow and with little words so you will understand it.

If you notice just about all of the users to this group use either their name and or call on their posts. They are not hiding behind mommy's skirts like you do. They are at least willing to stand by what they say and be identified as a real person. You on the other hand can only be taken for what you have presented yourself as. A faceless and gutless wanna be who can talk tough with the keyboard but does not have the balls to back up your dribble with the identity of a real person. In other words a typical internet troll who really does not have a life outside of your computer screen.

I don't believe you have ever passed a cw test. Just another tall tale from a wanna be who wants mommy to buy him a ham license rather than work for one.

>
>
> "Where's that big 'ol CB RAMBO??"

In the trailer park using mommy's computer and aol account

It should start at the local level for sure. I think most clubs already have a mechanism to handle some of these problems. The trouble begins when the offender just ignores or tells the club to bug off. What can be done then? Not much. If the offender is on a repeater the control station can take down the computer when he uses it. Local hams can refuse to talk with him. Enough complaints to the FCC may finally get them to take action but by the time that happens months may have passed.

HF is even harder. The offender does not have to worry about being ignored by the locals as long as he or she can find a similar buddy somewhere else to talk to. I don't think there are really that many bad ops. They just get all of the attention. Heck maybe the solution is to buy them all computers and internet accounts. Then they will find it is much easier and more responsive to troll the news groups and it does not take half the effort.

I've been known to beep '52' in Morse on the car horn when passing or being passed by an appropriately-antennaed car, particularly one with callsign plates. On at least one occasion, we ended up eating supper with another ham-family at a rest area -- both of us were carrying sandwiches and needed a break anyway.

The other method of getting attention in this situation is to display five fingers followed by two fingers; I've done that and gotten a response on the radio when traffic was heavy enough I didn't want to use the horn.

Check your local newsstand this month for an electronics mag (can't remember which one - Pop Electronics?) that shows how to build a POCSAG encoder. You hook up their simple circuit to your computer and your transciever (must be capable of the required baud rate) and can receive the POCSAG on a modified pager. They also cite two companies who are willing to sell pagers without paging contracts and will recrystal the pager to the frequency of your choice. The article lists some radio models that are capable of sending POCSAG, and while I didn't recognize the model numbers, at least one was an Icom, so I suspect it to be a ham-band transciever.

73 de Bob, KI8AB

(P.S. - there was a POCSAG decoder in the same mag in March '97, apparently)

Hummmm, sounds exactly like a fresh college graduate. I think the
experience one gains in operating, and building a station provides most
of what we as amateurs value as useful knowlege. We can then converse
in terms of our own experience. You should know this Dick. You expect
too much from "book learnin'".

Cross-posted to: rec.radio.swap,rec.radio.amateur.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

I have a pair of Radio Shack PRS-101 GMRS transceivers for trade. The radio are hardly used. They are ten channel, switchable 0.9 and 2 watts, complete with battery chargers for each. Jack for speaker mic or headset. New, they were $179.00 each. I would like to trade them for either:

1) a 9600 baud TNC or
2) a Yaesu VX-1R or
3) a Ranger 2950 or
4) a 6M mobile, especially interested in the Yaesu FT-690 or
5) an Index Labs QRP+ transceiver

If you have one of the above items and are interested in a trade, please contact me via e-mail. Thanks.

1512. Re: EXTRA CLASS PLUS LICENSE

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-15 00:00:00 UTC
From: cbrambo@aol.com
Message-ID: <19980115181701.NAA07012@ladder01.news.aol.com>
Source record: 181582

The bottom line is that there are no longer enough "pure" hams (as Michael puts it) who are into amateur radio specifically for the technical aspects. There are no longer enough of these types active on the bands to justify retention of the current (large) amount of spectrum space that is allocated to the amateur radio service. So, as Congress begins to bow down to their campaign coffers and look for spectrum to reallocate, amateurs have two options:

1) Invite newcomers, lessen and then drop the Morse requiremen (immediately to 5WPM or less for all classes of license, then remove when the ITU allows), and try like hell to get as many fresh voices on-the-air as possible. Then attempt to organize these newcomers politically and use their newfound strength to lobby for retention of the current allocations.

or

2) Keep discouraging newcomers, keep the code, watch the numbers of licensees continue to stagnate or drop (except for the no-code Tech class), and face the inevitable political reality of having more and more taken away from the amateur service by a Congre$$ who is only too willing to do so.

Those are the two choices. Which one do you prefer?

The difference is relevance, Jeff. Most people, including
busy working adults, and young people who are working to
keep their GPAs up, are willing to find the time to learn a
useful licensing requirement. However, Morse Code flunks
this test. It is not useful for anything except
recreation. Few hams join the hobby because they want to
use Morse Code. Morse is a passtime largely of elderly
hams; hardly an attraction in this age of the internet.

Can anyone help me with some additional XTAL HOLDER information.

Take a look at what I have so far:

http://www.mnsinc.com/bry/ham/xtalhold.htm

Take a look.

This will give everyone information about crystal sizes for SOME mid-era rocks. What I need to add is data on the OLDER ones like CR-1/A, FT-171 etc.

What about any overseas designations too? We could add them also!

Also, I need some of the newer ones like HC-33/U and HC-49/U etc. etc. Can you help???

A cheap solution...??
You're getting a harmonic of the 46mhz cordless band. I have the same problem with my motorola cordless and my 2 mtr rigs. My cordless give me a choice of channels with a button push. That solved <moved> my problem. Maybe your neighbor's phone is able to change channels the same way.

>2m has several times the range.

Try it using antennas of the same *physical* size on the two bands.
You may then be surprised to find out that 70cm will work better than
2m in most situations. The difference in path loss between the two
bands is almost completely due to the difference in effective aperture
of antennas of the same *electrical* size used on the two bands.

In other words, if you use an electrical quarterwave antenna on
each band, it should come as no surprise that the three times
smaller 70cm antenna will capture less signal power. But if you
use antennas of the same physical size on each band, the "path
loss" for the two will also be the same.

The reason for this is that the signal spreads out in a spherical
wavefront from the transmission point. At a given distance, there
will be a certain signal strength in volts per meter. For the same
transmit ERP, this will be the same on 2m and on 70cm. But if

your antenna is only a third as many meters long, it will capture
only a third as many volts. That's why the "path loss" is different
for the two bands. It really has nothing to do with attenuation
through the transmission medium, it is just geometry at work.

(Note that there are differences in the attenuation of various
transmission mediums, IE trees, walls, etc, at the various
frequencies too, but that is typically a minor effect compared
to the difference in antenna aperture.)

>With that in mind, how do the other bands measure up?
>10m FM, 6M, 2m, 220, 440 and 1.2G

The *physically* bigger the antenna, the less "path loss" it will have.
So if you use an electrical quarterwave antenna on each of these
bands, 10m will be best and 1.2 GHz will be the worst. If you use
antennas of the same physical size on each band, however, 1.2 GHz
will be best and 10m worst. (That's because the electrically larger
1.2 GHz *transmit* antenna will put more ERP toward the horizon.
Couple that with the now equal aperture of the receive antennas,
and the higher frequency works better.)

>What about mobile to base SSB? I have tried different bands on HF (with
>a very suspect antenna contraption on my car) but even with 100w the
>performance wasn't much better than CB and 2m FM was 100 times better
>(there were some kinks, i.e. polarization and a home-brew mobile
>antenna)

SSB will work better than FM in strict inverse ratio of their respective
occupied bandwidths when signals are below the FM threshold. When
signals are above the FM threshold, FM quieting will make it superior.
The FM threshold for most modern equipment is in the neighborhood
of 0.5 microvolts delivered to the receiver front end. So when both
signals are weak and noisy, SSB will do better, but once you pass
the FM threshold, the FM signal will have the advantage.

First let me appolagize for butting in on a discussion that I probalby have no bussiness getting in to.
I myself have yet to get my licence, but one day I hope to get it(when I get the time to study for it).

from what I've read of this discussion, it seems to me that the consern here as J Kelley said is
that it's not that people want to maintain the standard requirements to get in so much as it's
the standards of conduct. so wouldn't it be more appropreate to makee stricter policy on conduct.
that way the goals of the amateur service are maintained, and it will still filter out the "CB riff raff"
that you don't want.

once again, I appolagize for intruding(and for any spelling mistakes I made)

Hope to be able to talk to some of you on the air one of these days

>embrace ANY sort of no-code license in the mid 80s was directly responsible
>for the loss of 40% of your 220Mhz band in the late 80s.

There is no evidence to support the assertion that the League's
stance on code testing in any way influenced the direction of the FCC
in awarding 220mhz to UPS.

Even if ham radio had 2 or 3 times the number of hams it had back in the
late 80's (which would put the numbers at roughly where they are today, give
or take several thousand), there is no reason to believe that the outcome
would be any different.

Hams have this over-inflated value of their self-worth. The equation is
really simple: money talks. IF UPS wanted our frequencies, they would
have them, even if it cost a couple million more in "campaign contributions"
to grease the right palms to place pressure on FCC officials.

That's it, in a nutshell. Period. Concoct all the conspiracy theories and
doomsday scenarios you want; none of them are remotely valid, although they
make interesting fiction.

>How about you show us a breakdown of this, by license class. You will find
>what I say to be true; amateur radio is stagnant in all classes of license
>except for the no-code Technician class.

Once again, you're talking out of your backside.

I gave you the URL. Go visit the site and see for yourself. Your claim is
demonstrably false.

http://www.speroni.com/FCC has a complete breakdown, monthly, of all
license classes. The number of licensees in ALL classes has shown a
progressive INCREASE every year.

Despite the Chicken Littles of the world, Amateur Radio continues to be a
healthy, thriving hobby.

I guess you'll have to find another demon to exorcise, because your "code test"
demon turned out to be a charlatan.

take it out to back yard, wrap in multiple layers of aluminum foil, dig hole 4 feet deep, put wrapped radio in hole, replace dirt on top of radio.

There you have just protected your radio from EMP. Definitly 100% protection.

The survivalist whacko's always but two of every electronic device so they can use one and bury the other, for use after the big one and they return to the surface to rebuild our great civilization.

So you think abacus training equates to morse code training. My, MY.
You go ahead and learn the abacus and your 2meter HT, I'll take the
morse code on HF. If you lose your abacus (or your calculator), you can
always guess. I'll use my brain, with a pencil and paper to work
problems and makes notes if needed, since I was trained as a child to do
basic math.
Meanwhile I can still communicate and handle traffic over long and
short distances using morse code, while you're talking to yourself when
the ice storm removes power and destroys antennas on your local 2meter
repeater. (Of course I may do it the easy and use HF SSB, if that's
what's in use). You're still talking to yourself. Lotsa luck.

(He doesn't seem to know that the abacus was invented and used when
pencil and paper were unheard of, or far too valuable to use routinely.
It was much easier to keep tallies on an abacus than to etch them on
stone or clay tablets, then throw them away afterward.)

The only FCC Form 610 acceptable after January 1, 1998 is the one dated
September 1997--that is the latest version of the 610.

Mike this simply is not true, I went to the FCC site you mentioned earlier
and noticed the number of "Novice" licenses has steadily declined for the
past five years. You mentioned the site, look for yourself!!

Hi fella's,

In my opinion morse code is pretty much useless except that its tradition adds depth and character to amateur radio as a whole. It lets us touch the old ways and to master it is an accomplishment that can be felt to the soul. Americans are leaning way to far to immediate gratification in my opinion and morse code puts on the brakes just a bit. If you want full privileges in your heart you will sit down every night after work or school and keep trying until you master it! Good luck to all of you... Mike Burch K8MB (Got extra class at age 17) so you can do it also.

This seems to make sense until you look at licensing figures. There are more licensed now than ever before. It is more likely that *increasing* numbers have led to the proliferation of covenants, if there is any correlation at all. Such restrictions are in fact general not directed at hams exclusively, but at a variety of "nuisances," creative landscaping, treehouses, washlines, etc.

Source record: 181420

As a radio operator in Viet Nam we sometimes worked under what could be referred to as "harsh conditions". Our antennas were frequently brought down by incoming mortar or artillery fire. Electricity was a luxury provided only by generator or, in the case of the man-portable (?) HF SSB unit, by 74 (count 'em!) flashlight batteries. We were always looking for ways to improve commo. Hell, we were sometimes satisfied just to maintain marginal commo!

We had voice nets on HF and, if the camps were close enough, on VHF FM. Of course, we also had HF CW net. Some of the things we learned:
a) Since antennas get knocked down, why not put them IN the ground. We used BURIED antennas for backup commo.
b) Since the amplifier class of operation determines the efficiency of the final amplifier, in an emergency you want the most power out for the least power input -- consistent with maintaining communications. Ask yourself this question: If you had to operate on a very limited power source (e.g. battery) for an undetermined length of time, would you want a lower efficiency plate amplifier -- such as Class AB? Or would Class C be better?
c) When atmospheric attenuation degraded the VHF FM voice signal such that it was unusable, good ol' GI ingenuity prevailed. We would key the FM mic holding it next to the KWM-2A speaker and generate CW using the sidetone on KWM-2A. Even though a voice signal was unintelligible, the CW could always be copied.
d) When the s*** hit the fan, we always tried to use our fastest CW operators -- for obvious reasons. At times our CW net ran at 30-35 WPM. At this speed we found that, even if we missed every fifth letter (lightning crash, signal fade, etc.), we could still decode the text. In this sense the CW was very tolerant. In fact at this speed we learned tricks like NOT copying the letter 'e'. We copied all CW traffic by hand. At 30 WPM the letter 'e' was simply too short to allow time to write it down.
e) If you communicate with the same people via CW long enough, you will know who is transmitting just by the sound of their code! Our traffic nets seldom used callsigns -- much to the chagrin of ASA. Didn't need 'em!
Code, we found, is just another language -- like French, German, Swahili. As a language, you develop an accent.... and you do so in code. The mistake most people make in learning code is to learn 'B' as a dash followed by three dots. Believe this and you will probably never get past the 13 WPM barrier. Here's an analogy -- If you are in a theater and someone stands up and shouts:
F (the letter 'F')
I (the letter 'I')
R (the letter 'R')
E (the letter 'E')
What would your reaction be? Probably not much. However, if someone stands

up and shouts 'FIRE', what would you do? It is therefore the composite *sound* of this dash and three dots that makes the letter 'B'. When our 'new guys' arrived in-country, we tried to explain this perspective on code. If people having trouble with code understood this, perhaps it would help them.

Many new hams do not realize that ham radio was granted (and keeps!) frequencies for two underlying reasons:
a) To develop a pool of trained radio operators for periods of emergency.
b) To encourage experimentation and development in the field of radio communications.
It is imprudent to throw away/do away with *any* resource that *could* be beneficial in an emergency. Unless you have actually operated under truly emergency conditions, you have no basis to make statements regarding the ability to 'punch through' and communicate. Lacking this experience you are merely mouthing the opinions of someone else unqualified to judge. I refer to this act as 'the unknowing leading the dumb'.

I will concede that there are probably some CW'ers that would like to disallow voice communications. But that would be as self-serving as doing away with CW. CW is a requirement of this class of service. Privileges are based, in part, on one's proficiency with that mode. All are free to join... and are welcomed! (Many of us have conducted code classes to assist others get their license.) BUT... If one does not subscribe to the tenants of this group, then freedom allows that individual to select another group. To do otherwise is simply another case of the "Have-not's" bitching about the "Have's".

Perhaps we all should move to Quebec..... We could start a movement to do away with French! I can't learn it... I don't want to take the time to learn it... English is more universally spoken.... Therefore, French is simply no longer needed. After all, just because they have been speaking French for years is no justification for requiring it. Isn't that a *cute* idea?

In view of todays digital everything our actions then must be viewed as practicing witchcraft. But because of my experiences, no one will ever convince me that there will never, ever be another need for CW. I hope that we as individuals or collectively as a country will never be in a situation where marginal commo is all we have. For if that is the case, there will be a high demand for burned-out Morse operators. Besides.... CW *was* the first digital signal. [A1 through on/off keying]

To the 'no-coders' I say: "Welcome to ham radio". I will not require you to grow a beard. Nor will I ask you to change your religion. I will respect your preferences.... so long as you respect the preferences of others. YOU have asked to join a community whose principles, privileges, traditions and values were earned and established by those who preceded you. Should you not espouse these values, then you have mistakenly joined the wrong group.

JAVASCRIPT BEAM HEADING CALCULATOR
http://www.mailbag.com/users/hanelson/beamhead.htm

Hi Gang!

I've just posted a project I've been working on for the last few days in an effort to learn something about JavaScript-ing. I'd appreciate all critical appraisals, suggestions, and additions. Please give it a try. The database currently holds about 900 DX entries.

It seems to work fine with Netscape 4.04. I've not been able to test it with other browsers.

Please be sure "Java" AND "JavaScript" are ENABLEd in your browser

http://www.mailbag.com/users/hanelson/beamhead.htm

Thanks a bunch

Harv/KG9GA

Did anyone notice the TV Guide crossword puzzle for the Jan. 17-23
magazine?

One of the questions (1 down as I recall) asked for 'Ham Radio Operator'
and the 4 letter answer was 'CBER'.

I am impressed with the editorial literacy of the Crossword puzzle group!

>your power output to a watt or 2 first before asking for the
>frequency mod.

Why would you do that when the limit is 4 watts, not one or two? And besides, what difference does it make from a legal standpoint? This radio would not be legal for use on Citizens Band whether it was running 400 milliwatts or 400 kilowatts. Might as well crank 'er up if you're gonna use 'er!

2 Output filtering

The output filtering on your rig is
>optimized for the ham bands. You need to get yourself a nice PI network
>tuner to those harmonics off, and know somebody with a scope to check your

>output.

Okay. This makes sense.

3 Responsible operating.

I would have to see evidence that you are
>a skilled and responsible operator
> before turning you loose on CB with a rig
>capable of runnong 100 watts, tuning
out-of-band- split, and off- frequency.

"Turning you loose?" Gee, I didn't realize his operating procedures were your personal responsibility. He didn't and does not need to ask your permission in order to operate his radio.

>I would have to be convinced that you
are concerned enough about the quality
>of your signal to learn about spectral
purity and how to test your output
>with o-scope, spectrum analyzer, etc. I
would have to be convinced that you

Right. Just like the "real hams" on 75m, most of whom routinely run several kilowatts of illegal power with which to jam, antagonize, annoy, harass, and utter profanity unto their fellow amateurs.

I will give you a hint. If you study RF design for a few
>months, you might be
able to figure it out from your schematic. If you find
>it on your own, I guess
you will have earned the right. If not, it is
>irrelevant... nobody can stop
you from modifying your radio... only using it
>in an illegal manner.

You just made the point that it is NOT illegal for him to modify his radio...so just give him the freakin' mod and let's be done with all this foolishness.

Even with good operating practices, legal output, etc,
>you still can't legally
use your rig on CB mainly becaise it has the
>capability to tune off-frequency.

Oh, yes. Heaven forbid THAT should ever happen!

OK, so where does that leave us? Well,
>Andrew, you still have yourself a nice
ham rig there, and there is one thing
>you canuse it for legally besides just
SWLing.... working other hams using

>your own callsign issued by the FCC.

Did he ever say that he was interested in becoming a ham?

Getting licensed is not such a big
>deal. 6 year old kids have earned ham
tickets!

But he's not interested in becoming a ham.

>There are deaf hams, blind

Why is it that you HAMBOS always assume that EVERYONE is just chomping at the
bit to become a ham operator? It's simply not the case.

(several more words of pro-ham, pro-code preaching deleted)

> Just
realize that for most new hams
>with HF priveleges, the biggest hurdle to
getting on the air is a rig, and
>you have one that most new hams would trade
their teeth for. Shame to just
>use it for bootlegging!

Actually, the "Texas Sugar 830" makes a very capable 11meter radio if it is
modified and operated correctly. I would highly recommend it over modified
CBs, "export" radios, and the Rangers/Emperors/2510s. Good choice of radio,
Andrew. Hopefully, someone will now quietly e-mail you the mod you're looking
for so you can begin enjoying your radio and utilizing it as you choose to.

"Where's that big 'ol CB RAMBO??"

1558. RF measurement tool definition

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-16 00:00:00 UTC
From: rampelbergh.p@infoboard.be
Message-ID: <34c6bc3b.5156963@news.ib.be>
Source record: 181465

Who can give, or where can I find, an 'official' definition of:

What's a RF measurement tool (device, equipment, circuit, ..) and in
what aspect is it different from radio communication?

Additional question in the case its not different from radio
communication,

How do you explain the 'radio communication' aspect of a measurement
tool who can, for instance, be designed and used as a direct link
between the Unit Under Test (UUT) and the equipment?
I'm thinking for instance of a RF wave generator to align filters and
a oscilloscope to monitor signals.

When I push the reasoning a little more:
Is any signal communication circuit, like a gates whith a led
indication, a radio communication circuit?
It can display for instance validity of data and at such its a
measurement circuit (and if more elaborated, a tool).

Thanks on beforehand for your inputs. Best regards,

Agreed to a point ... rules/regs can ONLY be "memorized" ... "safety
issues" require at least some elementary knowledge of theory.

> Radio THEORY is completely unnecessary in today's predominently
> store-bought, appliance-operator world.

That is COMPLETELY absurd and anyone with a brain and the ability
to understand the basis and purpose of amateur radio as defined by
the ITU and FCC part 97.1 knows better.

Perhaps you should come back if/when you gain a rudimentary
understanding of what ham radio is about, Mikey. It's quite
obvious that you currently haven't a clue.

NOT TRUE. The number of General and Advanced class hams has been
declining (total numbers in each class) over the past two years. The
'new' hams in those classes are not enough to replenish the numbers
who die or do not renew.

Hi Frank - Wow, you were around in 1923? Incentive licensing was first implemented at that time: Only those hams holding the Extra First Class amateur ticket (requirements: Licensed for two years, pass an exam similar to the commercial first-class test, copy 20wpm, have a clean record) were allowed to use the 200-220m band. All other licensees had to remain below 200m.

Hi Roger - So you're implying working people are busier today than
yesteryear? I guess these days must have more hours in 'em, for my
dad put in 12-15 hour days for many many years building his business
decades ago. One wonders how working hams of yesteryear could find
the time to learn the code, yet today's working hams can't...

>licensing, which practically killed off the hobby in short
>order. We never, never learn.

Second time tonight I've seen reference to incentive licensing. IL was
first tried in 1923 and was very successful. Too bad the hams of the
60s didn't react as well as their counterparts of the 20s. Rather than
looking forward and seeing IL as something good for future hams, they
whined and whined about losing small slivers of frequencies, that could
easily be regained by attaining a higher grade of license.

Jeff KH2PZ, H0CW

P.S. Say Roger, please tell me how several thousand hams quitting
would result in practically killing the hobby? Even if every
ham losing frequencies had quit, the hobby would still exist.
Even if there was just one ham left in the US, the hobby would
still exist (and boy, would he be rare DX for other countries!).

Easy, Jeff:

1. Typically, the hams who quit over issues like incentive licensing tend to be the active hams. The inactive ones don't know, don't care, etc. We saw this in Incentive Licensing, which ushered in two decades of stagnation and decline, rescued only by the no code Tech program.

2. Boy are you naive. Cut the number of hams below some threshold, and the government will run, not walk, to take away our bands.

3. Our lack of numbers has already translated into the proliferation of restrictive CC&Rs regarding antennas, local antenna ordinances that flout PRB-1 (the burden of overturning such is on the ham, and it is an expensive burden, as I know from experience), and the deliberate policy of consumer electronics manufacturers to not shield their products, i.e. telephones, etc.

Hope this helped.

license. Yes, yes, that's it... The no-code license. It is
>going to save
amateur radio. And here is why... <insert above quoted text
>here>

And it has. If not for the creation of the no-code license, you would have
lost a great deal of your VHF/UHF spectrum allocation by now? Want proof? The
stubborn refusal of the ARRL...the so-called "voice of amateur radio"...to
embrace ANY sort of no-code license in the mid 80s was directly responsible for
the loss of 40% of your 220Mhz band in the late 80s.

>2) Keep discouraging newcomers, keep the code, watch the numbers of
>licensees
>continue to stagnate or drop

"continue" implies an action which
>is already or is currently happening.
The number of new hams, in ALL license

The story below, at some points, again makes the false
assumption that there is an effort to elimiante CW as a mode.
NOT TRUE. The nocode test effort is exactly that...an effort
to eliminate the code test. I will presume that if there is any
interest at all in those that profess to the use of CW being
important, then they will continue the use, practice and
recruitment of others to the CW mode.

Today, 80m propagation was very good and I could hear to something...
so called "Liberty Net" and MISC.

What a garbage ?

I heard continuous non-sense laughing as well as continuous non-sense
CWs. and someone was sparking "This frequency is designated..... "
oh well...

I thought those foggies went through cleaning process... well...
seems not. 2m repeaters are much clean here in Montreal.

Take care.

If that were the case, we'd be known as hpms instead of hams, since his middle name was Percy. Don't make up "facts."

At that period (~1910), everyone in the radio field was an "amateur", and in fact, Maxim was one of the late players.

Yes and no. They want you to behave, AND learn 20WPM. There is no room
for change. It doesn't matter that the FCC has created the no-code Tech
license, no-coders are non-hams in their opinions. Its just that way.
Forget about them.
Go get whatever license you can, and enjoy it.

This directly conflicts with FCC license class data at

http://www.speroni.com/FCC

which shows the number of licensed amateurs, by license class,
as increasing by 30K from December 1996 to December 1997.

>Of the total, here's the breakdown by license class.

This data directly conflicts with data at

http://www.speroni.com/FCC

which shows a direct increase in the number of hams in *ALL*
license categories from December 1996 to December 1997.

>Looks to me like there is a LOT of upgrading going on.

>televisions, and other common electronic devices." Sounds
>like an anti-amateur provision to me.

Sounds more like an "anti-CB" provision to me. The average homeowner
is far more likely to have an encounter with a CB radio operator
than s/he is with a ham radio operator. News accounts are replete
with examples of CB operators causing interference with household
items, etc.

>Mikey is correct ...

I usually am, thank you.

>It is because the potential number of people
>who want them is far greater. (Kind of like I've been
>saying, Mikey, lack of numbers. Get it?)

Hmmm. You want "more hams" by eliminating the code test, yet you
pose the claim that the reason these restrictions are in place is
because of the fact that many more people would want a satellite
dish than a ham radio, and the dish is more unsightly.

>However, the
>record is replete with examples of municipalities vigorously
>applying such rules against amateurs.

An antenna is an antenna, isn't it? I'm sure as a lawyer you
understand the concept of 'selective enforcement' and how it can
totally ruin your position WRT future actions by establishing a
precident.

>Mikey is right ...

Of course, thank you. I usually am.

>Too bad this preemption doesn't include radio amateurs.

One would have to pose that question to our FCC officials, wouldn't we?

BZZZZZT. Sorry Dave. Thanks for playing though.

While true that the codeless tech license created a license class which
attracted a certain group of people whom would not otherwise be amateurs,
all license classes in amateur radio have seen an annual increase in their
numbers. Even if there was no codeless license there would be more hams
today than before the codeless license existed.

Let me begin by saying that I am a no-code tech. Now, don't erect any stone monuments on top of my body for being what I am. I plan to tackle code and the general class question pool in the coming weeks. I'm not pro-code. I'm not anti-code. I just recently discovered that there WAS a code/no-code issue. I just want to cut through the bickering and complaining that everyone is doing and say that I would HATE to make contact with ANY of you on ANY freq. on ANY band. It seems for me that most of the folks posting in this thread are only looking for something to gripe about or someone to argue with. Of course, I expect to get my share of flame mail about this from both camps. That, I suppose, is unavoidable.

"That's all I've got to say about that."

Which will be the least of your problems if you are on a commercial
flight. Probably everyone here knows this, but the use of a radio
transmitter or receiver aboard an aircraft is forbidden unless
permission from the pilot is obtained.

> Amateur Advanced

Hi Michelle -- the ARRL disagrees with you, see ARRL URL:
http://www.arrl.org/whyham.html

As to your definitive answer -- are you referring to Hiram Percy Maxim, cofounder of the ARRL??? Please tell us what person "A Genius in the Family" chronicles. Who is Hiram A. Maxim??? You certainly don't ascribe to any one book as being the definitive source, or do you???

The answers given at the original referenced URL have been published in many magazines and books -- it is an honest attempt to define the term -- much more than speculation, some of the authors were alive when the term was first used. But most state that inadequate documentation exists and that was my original premise, it still is.

As for libraries -- full of books on speculations i.e., JFK, Custer, Lincoln, and Nostradamus!! The real reason Custer lost the battle of the Little Big Horn was Crazy Horse!!! But most Library books blame it on Custer or Reno!!! You figure!!

What if Custer had 2 meter HT's????

Hello,
I'm not here to pick on William. Just to caution that we send
reasonable informative messages pointing out the error of the usage of
the terms. All I done is sent an email. Pointing out the error and that
many hams find the term cber derogatory and also directed them to the
ARRl's page for more about Amateur radio. 'sides I can't cancel my
subscription, I have never have subscribed to the publication.

Why should it cost any more than a regular call? A renewal is a
renewal. I thought the $50.00 fee was to cover the costs incurred from
additional work brought on by the vanity program.

Are they treating vanity callsign renewals like like the state of
Florida treats vanity license plates? Each time you renew you have to
pay an additional fee.

I'd been hoping radio amateurs were above stealing 'Net services through spam. While I'm sure some of the spam I've received was the result of my address being scammed from my postings on one of the amateur radio groups, I've been assuming the spammers were interloping profiteers, not real radio enthusiasts.

Unfortunately, today I was proven wrong. A piece of spam arrived, signed with a 1x3 W4 callsign. (in light of today's lawsuit-happy society, I won't identify the jerk -- but you know who you are, and I'm sure my fellow spam victims know too.) No, it wasn't a forged call -- the name & city checked out against the FCC database; it appears this junk really was sent by a licensed radio amateur. (and grade-A lid...)

If one feels they *must* steal my address from a ham radio group to spam me, can't they at least scam ham gear, not computer software??

when you use 110 ac for a stereo, the 60 cycles are changed to pulsed
d.c. ... then a large filter cap. filters out that ac hum. but with a
microwave you don't need that filter. it's pulsed 60 cycles.

Again another subjective statement. To pull an Extra class at 17,
obviously you have some talent at morse. All well and good for you, but
I have spent a good of time in my youth (about 3 years, in my teens)
and a few months now with the much more usefull computer study programs
without mastering it.

Source record: 181342

DANO:
The ancronym M.A.R.S. stands for Military Affiliate Radio System.
Basically a bunch of hams HERE ON EARTH who have VOLUNTEERED their Amateur
Radio Stations for the purpose of helping the military services (and their
personnel) keep in touch with each other and their families world-wide.
Has absolutely NOTHING to do with the "red planet" Mars.

The MARS has repeater allocations above the 2M (144-148) amateur radio
band, thus the "MARS MODS" to extend the transmit/recieve frequency ranges
of various Amateur Radio equipment.

_/ _/_/ _/_/ _/ _/ _/ _/ _/
_/ _/ _/ _/_/_/ _/ _/ _/ _/
-
Here is a summary of news items covered on edition #251 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 23-Jan:
-
1. Ice Storm '98 1/5 -- Weather Disaster Strikes US and Canada
2. Ice Storm '98 2/5 -- Emergency Communications Response
3. Ice Storm '98 3/5 -- Damage Assessment, Government Moves In
4. Ice Storm '98 4/5 -- Canada Hit Hardest, Millions Powerless
5. Ice Storm '98 5/5 -- Hams Collect Goods, Winter Hits Again
6. Storm Takes Down Towers, Affects Commercial Broadcasting
7. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
8. Weekly Propagation Forecast
9. Special Event Station Calendar
10. FCC Grinds Out More Vanity Call Signs, KB6ZV now W6ROD
11. DXCC Activity, ARRL Membership Down from 1996 Levels
12. AMSAT Seeks Commercial Work to Maintain Facility Operations
13. John Glenn to Fly on STS-95, A Ham Ticket in his Future?
14. League Offers "ARRL Audio News" Telephone Bulletin Service
15. "This Week" Initiates New Audio Cue Tones for Affiliates
16. "The RAIN Dial-up" from Chicago
-
Funding for the program's transmission and production expense was
provided this week by a grant from Gene Wicklund, W0ZOK, of
Horace, North Dakota, where "This Week in Amateur Radio" is heard
via satellite Saturdays at 8:00 PM along the Red River Valley on
the W0ZOK repeater on 443.75 MHz.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The
program is heard on the "W0KIE Satellite Network" each Saturday
at 9:00 PM (EST) on the Hughes Communications SBS-6 commercial
communications satellite, transponder 13B upper, located at 74
degrees west longitude in equatorial geosynchronous orbit. The
transponder center frequency is 12.019 GHz; tune up in frequency
to 12.031 GHz. Program audio is on the 6.2 MHz analog
subcarrier. A fee has been paid to W0KIE for access to the
satellite uplink.
```

-
On the WorldWide Web, program audio can now be found in several formats (including streaming audio) at http://www.roava.net/twiar through the courtesy of the Blue Ridge Video and Digital Society of Roanoke, VA, and at http://user.icx.net/~ke4hsm/twiar.html with thanks to Greg Williams, KE4HSM, of Knoxville, TN. The service is carried on VHF/UHF repeaters throughout North America and by WA0RCR on 160 meters at 1860 kHz.
-
Here in the Capital District, "This Week in Amateur Radio" is heard on our "flagship" repeater, WA2OQE/R in Troy, on 145.33 MHz, courtesy of the Niagara-Mohawk Amateur Radio Club. The program is repeated Mondays at 8:00 PM.
-
Production and transmission expenses are underwritten by donations from repeater operators, amateur radio clubs, and individuals. Further information is available from George Bowen, W2XBS, at 518.283.3665 (packet @ WA2UMX.FN32AW.NY.USA.NA or email kxkvi@delphi.com) or Stephan Anderman, K2SMA, at 518.664.6809 (packet @ N2TY.FN32DW.NY.USA.NA or email sanderman@delphi.com).

Yaesu has a new warranty policy. They will be pay shipping both ways for warranty service. Previously, you had to pay to ship to them; they would pay to return it to you.

Yaesu management hasn't told its customers about the policy. They didn't even tell their customer service people.

Mr. Mikio Maruya, vice president of Yaesu, confirmed the policy to me in a letter of January 7, 1998. "Please be advised that yes it is true, we did change our policy. In the U.S. when customers purchase our radios and if the radio does not work properly then of course we will reimburse shipping charges; (UPS/ground or regular parcel post only)!"

This policy has actually been in place since last July. I was told about it by the president of the company.

But when I called to send my FT-8100 back for service the second time, the customer service people told me they didn't know anything about it. So I wrote Mr. Maruya to confirm that it was in place.

If you need a copy of these two letters, drop me a note. I'll send you a photocopy.

My Ft-8100 had so many problems I asked them to replace the radio. They declined and I have since purchased an Icom 2710 which has been flawless so far.

yes. mostly. some people chit-chat what's going on on 80m and
40m... but they aren't "emergency."

>> specifically, the 2 meter band, being the most widely used VHF
>> band.

agreed.

>This not a local emergency.

it is a local emergency.

> There has been severe damage from
>Kingston and Ottawa all the way to New Brunswick.

yup, but I don't see any points transmitting signals west to AB, BC,
south to Florida, north to Alaska.

> I can see
>applications of HF and satellite communications to get stuff
>out of the very large affected area.

phones weren't damaged so much (compared to hydro) so we could use
cells, internet and something else.
HFs were typically useless at least in Montreal area.
Many people could chit-chat what's going on, but the frequencies
weren't used as "May-Day," or "Pan-Pan" more like "Securite"... if you
know the phrases for commercial traffics...

> Yea, he's made this claim several times. While I've never taught a code
>class, I've watched at least a hundred or so learn code and take the exam.
>NOT A CHANCE IN HELL did he learn it in a day.

I practised TX occasionally on 6m or something (my call sign), but
before the test day, I didn't practise RX... and I didn't know rest
20% of alphabets + numbers. On the test day, I spend all day for
practising and I passed the test.
I just had to remember dahs and dits. What a crazy stuff... too
easy. No wonder why it doesn't make good hams on HF.

It [CW] was easier than remembering 500 questions for written exam.
I took three days (not whole three days... a couple hours each day) to
remember half of the questions completely... and took the exam and
passed my advanced near boarder line... it was much difficult.

> It makes you wonder if he
>really knows CW at all.

I don't have to know CW because I don't use it.
IT IS USELESS. If you want to stick to this obselete mode (it's
like sticking to abacus instead of calculator), go ahead... but if you
force or laugh someone because she/he doesn't know CW, you look very
silly. If I force or laugh you because you don't know abacus, I must
be silly...

Please be considerate.

Like most of the things you say M@s@ your statements regarding how your learned morse are full of inconsistencies. You first claim to have learned morse in one day and passed it. In the above you claim to have known 80% prior to test day and then studied the remaining 20% just prior to taking the test. Yet you say you didn't practice "RX" before the test day. I can't help but wonder how you knew 80% without ever listening to it. I just wanted to let you know that those of us who have spent the time to learn code and send it with any amount of proficiency know that you are full of shit. So dream on Cutie boy, but your not fooling anybody.

CW is too easy (this is the major problem), obselete and non sense to
force someone for giving HF privilege. Take this requirement away
and replace it with difficult or more practical written exams.

Body handling: Binary attachment payload not displayed: vcard.vcf

Hi all,
While I'm waiting the weekend for Yeasu to open I thought I'd find out what kind of repair bill I' looking forward to. I constructed a patch cord, according to the mods sent to me by Yeasu Tech support, which was supposed to supply power from the 13v outlet in the back of the FT840 to an MD100 mic (to run the mic's filters). The cord was a combination of two .33uf caps and a voltage regulator, supplying 5v to the Mic. I tested it--no shorts but when I plugged it in, the meter pinned, the radio went dead, and there was a smoke smell. Now when it's turned on, the meter pins and there's no sound.

Any ideas, what happened and what's going to cost to fix? Also, does anyone know if
Yeasu is open Monday 1/19?

Thanks in advance.

Well to tell you the truth, if it wasn't for the no code there would fewer hams today. I know of several people around where I live who migrated from cb to ham radio. When they got tired of 2m and 440, they learned the code. I got my tech license before there was a no code version, All that I did was promply forget it.
So now I gotta relearn the code so I can get my general. (I am buying an hf rig.) 2m sucks where I live.

I don't know about there being "no definitive answer". If I remember
my Amateur Radio History correctly, the word "Ham" is an acronym. The
letters are H.A.M. which stands for Hiram A. Maxim who was one of the
early radio amateurs.

Anyone interested would be better advised to go to the nearest library
and request the book "A Genius in the Family" instead of going to a URL
where there is mere speculation.

>at hams exclusively, but at a variety of "nuisances," creative
>landscaping, treehouses, washlines, etc.

Roger, a die-hard member of the No-Code Agenda, went to the Carl Stevenson Fact Fabrication Academy and graduated Magna Cum BS.

Roger *knows* that the primary reason for most antenna covenets (which in most instances don't just single out amateur antennas -- they often cover ham antennas, television antennas, satellite dishes, and so on) is very simple, and has absolutely *nothing* to do with ham radio, or morse code. However, as a member of the No-Code Agenda, he has to post a required amount of distortion, fabrication, and obfuscation on a regular basis. Being a lawyer, this comes to him naturally.

In reality, the reason for restrictive covenets is quite simple, and if you peruse other USENET newsgroups that deal with homes or construction (such as the rec.satellite newsgroups) you will see that these deed restrictions are discussed by many people they affect. The most common reason given for why these restrictions are so popular today is as follows: Whenever a new housing community is built, the contractor has to pay the cable company to run cable to each house. Instead, many cable companies agree to do it for free, if the contractor puts a restrictive covenet in the deed to prevent people from breaking free of the cable monopoly by buying their own antennas. The contractor reduces his costs, the cable company ensures its monopoly, and the homeowner gets screwed. Everyone's happy.

Of course, this is the reason I've seen posted on the rec.satellite newsgroup, so I suppose it is jaded by the common interests of that newsgroup. But, in life whenever something strange is happening the "golden rule" always shows the way: Follow the money. So, the abovelisted reason doesn't sound too far off track.

Nice try.

If things continue at their current pace, there will be almost 1,000,000
licensed amateurs in 2008 (if we linearly extrapolate current annual
growth of 30k amateurs for 10 years).

FCC statistics support this claim: http://www.speroni.com/FCC

Don't listen to Spew Durigan, aka CBBimbo -- he has a bad case of

1638. Smallest signal possible into a receiver?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-17 00:00:00 UTC
From: electron78@aol.com
Message-ID: <19980117171501.MAA14167@ladder01.news.aol.com>
Source record: 181365

What is the lowest signal, in dBm or watts, that the average VHF communications receiver can pick up ? Can a signal at the antenna of a VHF receiver be as low as, lets say, 1nW or -60dBm (with a rubber ducky ant) and still be received above the noise? Or would a VHF receiver need a stronger signal to receive voice or even CW? Thanks for any help!

Mike

Okay, here is a copy of the results from the W5YI report on the licensed radio amateur population...thanks to Cecil W6RCA for the source and thanks to Tom NE7X for forwarding it to me...

Thanks to the W5YI report, here are the latest statistics
for amateur licenses in the USA as of 12/1/97.

Total licensed hams: 719,341

This total is only 1.1% increased over last year at
the same time. The net increase is only 7582
over December 1, 1996.

Of the total, here's the breakdown by license class.

Extra: 75,694 an increase of 2176 which represents
an increase of 2.9%. The percent of all hams that
are Extra is now 10.5%, up from 10.3%.

Advanced: 112,482 a decrease of 1922 which represents
a decrease of 1.7%. The percent of all hams that
are Advanced is now 15.6%, down from 16.1%.

General: 124,415 a decrease of 2299 which represents
a decrease of 1.8%. The percent of all hams that

are General is now 17.3%, down from 17.8%.

Tech Plus: 147,559 a decrease of 782 which represents
a decrease of 0.5%. The percent of all hams that
are Tech Plus is now 20.5%, down from 20.8%.

Tech: 179,226 an increase of 18,636 which represents
a increase of 10.4%. The percent of all hams that
are Techs is now 24.9%, up from 22.6%.

Novice: 79,965 a decrease of 7582 which represents
a decrease of 10.3%. The percent of all hams that
are Novice is now 11.1%, down from 12.4%.

Looks to me like there is a LOT of upgrading going on.

Regards, Frank

Actually, one of the areas of law in which I am somewhat
more knowledgeable than average is that of homeowner's
associations. One of the frequent boilerplate items in
CC&Rs includes a provision making it the transmitter's
fault, in the event of "interference with telephones,
televisions, and other common electronic devices." Sounds
like an anti-amateur provision to me.

Mikey is correct that many anti-antenna ordinances are
primarily aimed at satellite dishes. Of course, this isn't
because such antennas are more "unsightly" than those used
by amateurs. It is because the potential number of people
who want them is far greater. (Kind of like I've been
saying, Mikey, lack of numbers. Get it?) However, the
record is replete with examples of municipalities vigorously
applying such rules against amateurs.

> Instead, many cable companies
> agree to do it for free, if the contractor puts a restrictive covenet in
> the deed to prevent people from breaking free of the cable monopoly by
> buying their own antennas. The contractor reduces his costs, the cable
> company ensures its monopoly, and the homeowner gets screwed. Everyone's
> happy.

Mikey is right about this. This is precisely why the FCC
recently pre-empted all contractual restrictions against TV
antennas, i.e. CC&Rs. It was an anti-monopoly rationale.
Too bad this preemption doesn't include radio amateurs.

Usually, Mike, received signals are measured in microvolts. If a receiver can hear 1/2 uv it is doing ok, is the conventional wisdom.

You can do a lot with a good lownoise gasfet pre-amp and state-of-the-art DSP, but there are miracles, and then there are miracles. FM especially is affected by very close signals, and exhibits what is known as the "capture effect". The reciever will tend to lock onto and demodulate the stronger of two signals in it's passband. A pre-amp could aggravate this effect at times, or it might help at other times. A DSP audio filter will help somewhat, especially for CW or MCW. Just set up your passband filter at 500 hz, rock your tuning to put the CW note right in the middle, and narrow your filter down in increments to 100 Hz or so and you will get much better copy as long as the frequency doesn't drift out of the passband.

For the audio filter to work, though, the signal has to get demoddulated in the first place, and so you will want to try a pre-amp when you cannot hear the weak signal without it.

By the way, forget the rubber ducky. Even a telescoping whip is better. For weak signal work, you really want a gain antenna designed for the frequency of interest.

Hello All.
I came across a wwv receiver made by Communitronics LTD, its model number is 6011b, it has a black face,a few bnc connectors in the back,and two in the front.
Any info out there on what this receiver was used for, where this company is located.
Also looking for a manual for the same, will pay for a xerox copy.

Thanks

JAck

for receiving, you can't adjust the speed.

for sending, you can adjust your speed as often as you feel
comfortable.

that's why receiving is usually more difficult.

On the one hand, we have Cecil saying:

``What's funny, Bill, is that one of the retired old HF phartz
who uses the open Intel repeater, is complaining that a
particular conversation on the repeater was "gobblygook". The
topic of that particular "technical" conversation involved
complex impedances. "What the h___ does 'j' stand for? Why
don't you guys talk in English?" When I explained the function
of 'j', the old guy thought I was pulling his leg. :-)''

And his pet, Carl, in full agreement:

``That's typical of the "Morse Forever" CW Olde Farte who dominates
the ARRL/FISTS/etc. ... who was barely competent with a 2-tube rig
(if that) and stagnated into complete incompetence when more modern
technology like semiconductors, microcontrollers, DSP, etc. became
practical realities, even in every-day, low cost consumer devices.''

But, on the other hand we have Roger saying:

``Why? Why do we need these things? When I look at most of
the questions in the pool, I mainly see things that I
learned strictly for passing the test. Not things that I
use being a radio amateur. All that crap about figuring out
impedence, and those other formulas. I passed 'em all, back
in the days of FCC testing (except for the extra: took it in
'92) ... utterly useless. (I rarely have met any amateur
who ever used any of that crap). The stuff that I have
really used, such as RFI abatement techniques via toroids,
grounding of the station for safety, etc., is conspicuously
absent from the tests. Exception: regulation stuff like
band limits, power limits, etc.''

It's scary that these folks want to rewrite the licensing requirements.
Roger calls the formulas "crap" yet Cecil and Carl deride an OT'er for
not knowing them.

If this is typical "agreement" within the no-code camp, I believe the
code is safe and sound for a long time to come.

As usual, your conjecture is full of holes. During those two
decades of "stagnation," our numbers increased, the 1979 WARC
provided us three new HF bands, new products and manufacturers
appeared, et cetera.

Sure, there was a lot of foot-stamping and chest-pounding at ham
clubs and in the letters to QST, but just how many amateurs perminently
quit the hobby? Do you have any numbers (other than hear-say)?
Anyone who perminently quit because of the loss of a few slivers of
frequencies (which could easily be regained by upgrading) was short-
sighted, not seeing the benefit IL provided future hams; if any actually
left *perminently*, we should be glad.

>2. Boy are you naive. Cut the number of hams below some
>threshold, and the government will run, not walk, to take
>away our bands.

During those two decades, pressure on our HF spectrum from
other services was at its greatest, yet, we gained three new
bands. "Boy, are you naive."

>3. Our lack of numbers has already translated into the
>proliferation of restrictive CC&Rs regarding antennas, local
>antenna ordinances that flout PRB-1 (the burden of

Fewer numbers would have resulted in fewer RFI complaints and
fewer towers - we would have been noticed much less.

>Hope this helped.

Nice try.

1671. Re: DC and RF Grounding Problem--Severe RFI

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-18 00:00:00 UTC
From: KF6IEG <jimsmit@ns.net>
Message-ID: <69u625dfl1@aurora.ns.net>
Source record: 181188

All electrical systems must have an accessible connection to the grounding electrode conductor and the grounding electrode. Most homes will have a removable plate adjacent to the electrical service panel, which when removed will expose the connection between the grounding electrode conductor (usually a copper wire) and the grounding electrode (usually a 20' piece of rebar sticking up out of the concrete footing). If this is not the case, the situation should probably be remedied. In some cases the grounding electrode is a copper wire in the concrete footing that extends all the way to the panel. Some older homes do not have this type of "ufer" ground.

While you may want to install individual grounding systems, it is important to remember that the National Electrical Code requires that they must all be bonded together at some point. All metal systems are also required to be bonded to this system. This includes water pipes, gas pipes, and metal structures. If they are not bonded together you can read a potential difference between systems with a volt meter even though they are grounded to the same earth. This can cause all kinds of trouble and possible hazards.

One thing I've done before is to use a roto-hammer drill to drill a hole through the concrete sidewalk. Then you can drive a ground rod through this hole into the ground. If you want to see only the wire coming up out of the concrete after it's patched, you can use an Erico Cadweld "One Shot" to weld the wire to the ground rod. This would probably have to be special ordered from an electrical supplier. Do yourself a favor though. Spend a little extra money and buy a 5/8th" or better yet a 3/4" ground rod. Sometimes a 1/2" ground rod will bend when you hit a hard spot. If you're lucky enough to get past the hard spot you'll probably never get that bent rod driven in, or back out. At times I've used a compressor, jackhammer, and a ground rod attachment to drive rods. This can be very difficult until you get a good technique down though. Usually I use my demolition hammer with a ground rod driver attachment. This is much faster and easier than a sledge hammer.

The way we add ufer grounds to homes that don't have them here is to dig a 20' trench 1' deep as close as possible to the footing. Drive a PVC stake into the trench about every 2' or so to tie your electrode to. I'd recommend running at least a #4 bare copper wire through the trench. Encase the wire with at least 3" of concrete on all sides.

Whether you use the ground rod, the ufer ground, or both, remember you must still tie them to the electrical system ground.

Hi BCU,
First, good luck in upgrading! Your efforts will be rewarded a thousand
times over - HF is pure magic.

It's too bad you stumbled across the .misc NG - it's not for the weak
of heart. Try the other rec.radio.amateur.* NGs, such as .antenna,
.homebrew, .space, .dx, .boatanchors, to read about other aspects of
the hobby. If you're interested in building and low power operation,
the e-list QRP-L is exceptional in content. There are e-lists running
that cover all aspects and modes (including ATV, RTTY, Moonbounce [called
"EME" these days], meteor scatter, public service, 160m, towers).

If you choose to read only .misc, at least you'll realize that hams
are quite vocal in their convictions - it would be very bad for the
hobby if that weren't the case.

1675. SSB damage radar??? Help

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-18 00:00:00 UTC
From: "T.O. Galloway" <tgall@erols.com>
Message-ID: <34C2A4A7.62E185FD@erols.com>
Source record: 181192

The setup:
On a sailboat the back stay is split and insulated being used as the SSB antenna with a tunner. 100 watt unit.
About 6 to 8 feet away is marine radar unit. The radar dome being at about the same level as the bottom of the SSB antenna.

The question:
If the radar is on and running, will transmitting on the SSB damage the radar unit? An electronics company that installs these units advises a friend of mine against this setup and wants to put the radar in a different (more difficult and more expensive for my friend) location. I have never even heard of such a precaution before.

Is there anybody out there with radar experience that can verify or deny this claim?

Thanks
T.O.

You've got that a bit backwards, Brian. It took the invention of the
triode tube (~1919) for CW (continuous wave transmission) to come
about, yet SSB was being experimented with over the telephone lines as
early as 1915.

I recall having a great QSO with a fellow HAM for about 2hours on the
Pennsylvania Turn Pike heading west, around the Allegany Mountains he left the
Turn Pike and I continued West and we were able to maintain communications with
an area repeater, I believe we lost contact after I went into the first or

second Tunnel. It really made the trip enjoyable and time pass.

But getting a simplex QSO to last that long on a trip is not the norm.
Here is a tip that I have heard some people use. When going on a trip,
make up a small sign for in the back window with your call and 146.520, and
have your rig set to monitor that Freq or have it as a Call freq so you can go
elsewhere, but still have the rig monitoring that as priority freq.

If any HAMs get behind you with 2 meters, you may get a QSO. :)

Good luck

[numbers up to ~275K, or roughly 27% of the total ham population.

Your numbers don't work without working a couple of other percentages:

1) nocode Techs upgrade rate
2) Death rate of G, A and E licensees vs NCT

If a lot of G, A and E types die off and are not replaced by Techs
upgrading, then the whole equation will skew toward Techs.

Considering the number of appliance operator Extras I have known who
looked down on my Tech license over the last 17 years, who were
absolutely incompetent with a soldering gun (Hi, Alan!) and who
couldn't pass emergency traffic even when lives depended on it, I just
can't help but wonder how much nicer it would be if the ARRL had just
given up the stupid "incentive licensing" scheme in the first place!

Hi George
It is not me but I thought the 80 meter novice subband was from 3700
to 3750?
As far as I am aware of, we Canadians respect the u.s. novices by
keeping voice above 3750. I must admit, I have not been on 80 for
over 20 years so I could be embarassingly mistaken.

Reduced price of ASAPS in the UK

The internationally respected HF propagation prediction software ASAPS for Windows is now available in the UK at a reduced cost

---

18/01/98 -- The internationally respected ASAPS for Windows HF propagation prediction software package from IPS Radio and Space Services is now available in the United Kingdom at a reduced cost. The reduction is the result of favourable exchange rate condistions which can be passed direct to the customer. Simon Collings, Radio Communications Consultant is exclusive UK distributor for this professional MS-Windows package.

The IPS Advanced Stand Alone Prediction System (ASAPS) allows the prediction of communications conditions in the HF radio spectrum. It is based on an ionospheric model developed by IPS Radio and Space Services of the Australian Department of Administrative Services, and CCIR models (CCIR reports 322, 894 and supplement to report 252-2).

For more details of the package, visit:

http://wkweb4.cableinet.co.uk/simon.collings/prod09.htm

ASAPS is distributed internationally as follows:

For United Kingdom sales and information, contact:

Simon Collings, Radio Communications Consultant, 46 St. Michaels Road, Cheltenham, Gloucestershire, GL51 5RR, ENGLAND
Fax/Voice: +44 1242 514429

And, of course, the pilot is unqualified to make that judgement. Plus,
since his employer has legal responsibility, there is likely a company
directive in place which already says "No."

The same answer as on the ground - "line of sight" (for RF, a percentage over the optical line of sight due to refraction). Greater distances are possible (as on the ground) when propagation conditions permit (sporadic E, F2, etc.). Line of sight distances can be calculated using ordinary mathematics.

Also, remember that transmitting from aircraft is subject to many rules, depending on your location and the type of aircraft (example: all transmissions from US commercial craft are prohibited).

>Total licensed hams: 719,341

Gonna be tough to make 1,000,000 by 2008, as our friend Deegie Howser claims...but that's another soapbox.

>This total is only 1.1% increased over last
>year at
>the same time. The net increase is only 7582
>over December 1,
>1996.

Okay. A small increase overall. But let's look at the breakdown of coded vs no-code tickets, shall we?

>Of the total, here's the breakdown by license class.
>Extra: 75,694
>an increase of 2176 which represents
an increase of 2.9%. The percent of
>all hams that
are Extra is now 10.5%, up from 10.3%.

This would make sense. There will always be a group of people who want "the best", regardless of whether it's something of necessity or not. They are achievers who will do whatever it takes, relevence nonwithstanding, to get to the top. Single people buy Cadillac DeVilles and Range Rovers because "they can." Makes them feel a sense of accomplishment. Nothing wrong with that.

>Advanced: 112,482 a
>decrease of 1922 which represents
>a decrease of 1.7%. The percent of all
>hams that
>are Advanced is now 15.6%, down from 16.1%.

That's 1/5 "coded" classes that shows a decrease. The number of new Advanced hams is less than the number who have become silent keys and left the hobby.

>General: 124,415 a
>decrease of 2299 which represents
a decrease of 1.8%. The percent of all
>hams that
are General is now 17.3%, down from 17.8%.

That's 2/5 "coded" classes that shows a decrease. Ditto my comments for Advanced class, above.

Tech Plus: 147,559 a
>decrease of 782 which represents
a decrease of 0.5%. The percent of all
>hams that
>are Tech Plus is now 20.5%, down from 20.8%.

Make that 3/5 "coded" classes that shows a decrease.

>Tech: 179,226 an
>increase of 18,636 which represents
a increase of 10.4%. The percent of all
>hams that
are Techs is now 24.9%, up from 22.6%.

Wow! A whopping 10+% increase in a year, and now comprising the largest class of amateur operator with 1 in 4 hams being a no-code Tech.

>Novice: 79,965 a
>decrease of 7582 which represents
a decrease of 10.3%. The percent of all
>hams that
are Novice is now 11.1%, down from 12.4%.

4/5 "coded" licenses showing a decrease.

Thanks, Frank. You have helped me prove my point. 80% of the coded classes of license show a DECREASE. All others except the top license class show a DECREASE in the number of licensees. On the other hand, the codeless license has increased it's numbers by 10.4% in a year! The ONLY other license class to increase, Extra, is up a mere 2.9%.

What does this tell you about Morse code and it's acceptance by today's amateurs?

Err, no, Spew (for people wondering, this comment quoted above is exactly
the reason Durigan was coined with the nickname 'Spew' -- he just throws
totally inaccurate or irrelevant comments around -- sort of like the time
he called all Mexicans 'lazy').

There are currently ~175k codeless techs. New codeless techs are entering
at the rate of about 800/mo, or 9,600 per year. Over the next 10 years,
that means we can expect about another 100K codeless techs, bringing their
numbers up to ~275K, or roughly 27% of the total ham population.

CW as an operating mode on amateur frequencies is only a few years older (<5)
than SSB. Thus, your claim is invalidated.

Sec. 91.21 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.- registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.
(b) Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

Using pro-code-test logic, I could say, It's not difficult at
all. I passed it without studying. You must be lazy. If I can
do it, anybody can do it (just like passing the MENSA exam) :-)

Hi Tim, knowing that he's learning English, it's pretty easy to figure out what he meant. He, most likely, didn't mean 20% but instead, meant 20 characters. Then everything else makes sense. Instead of jumping on an obvious literal misuse of English, how about trying to understand what he meant?

It figures.

My ISP's news server is down for two days, and when it finally starts receiving again, guess what's at the top of the list?

I think I'll keep the above as a reference for the year 2008. I"ll put it right next to the one from Bill Gates that reads, "640k ought to be enough for anybody."

Big, dumb gorillas are easy to tease when they're in a cage and there's a pit between the two of you...just watch that you don't slip on any banana peels they throw out. (I'll let you think about that one.)

I meant 20%. I had kinda idea of dahs and dits by seeing CW chart
prior to the test day (I knew numbers and simple alphabet something
like . = E, - = T), but I didn't practise anything.

> instead, meant 20 characters. Then everything else makes sense.
> Instead of jumping on an obvious literal misuse of English, how
> about trying to understand what he meant?

Gee Cecil, I didn't know the % sign had a different meaning in Japanese or English, perhaps his math skills aren't so hot either. But since your here to help translate Masa's posts perhaps you could explain some of his other posts for us, so that we might all understand him better. Like how you convert an HT so you can talk to the police on their frequencys and thank them for doing a good job, tell us what he really meant by that Carl, and tell us what he meant by having your ISP cancelled if you 'spams' on packet radio, make the connection for us on that one.

As far as his morse post, whether he meant 20 characters, 20%, or 20 wpm, it doesnt matter. I still think he's full of shit, you've been at this a while Carl, how many have you seen study morse START TO FINISH in 1 DAY and pass an exam?

Tim

Hi Joseph,

No apology necessary. You have every right to get involved in this discussion. Despite what some of the characters on here would have you believe, no license, examination, or Morse code knowledge is required in order to use the Internet.

BTW, this irritates them to no end. They believe that proficiency in the use of a slide-rule should be requried in order to use a computer, much as Morse knowledge is required for amateur radio operations below 30Mhz.

Yep, me too, I sorta knew a dash was a long sound and a dit was a short sound, or was it the other way around? Someone said they put these in a pattern and make letters and numbers, so I looked at the chart and then I could copy 5 wpm. Then I laid my head on an issue of the Radio Amateurs Handbook and through osmosis picked up everything I needed to pass the General, of course it took me until the following afternoon to build my code speed to 13 wpm. I also have several pieces of land which I am willing to sell for a very attractive price, I have two properties in southern Florida and one bridge in the the New York metropolitan area.

From: au@ix.netcom.com
Message-ID: <69thum$ceh@sjx-ixn4.ix.netcom.com>
Source record: 181268

I've heard 40 meter packet stations take over the bottom 5-10 khz of
the 40 meter Novice subband lately. Now after tuning through the
80 band, there is a loud (in Oregon anyway) new mode on 3700 which
is dead center of the subband. The Novices only have 50 khz to begin
with on each of these bands. Has it become common practice to operate
within the Novice bands?

Hi to all on the News Group !

My old TS 180 (and apparently a lot of other transceivers)
have a connection for interfacing a transverter.

I cant see any reference in my manual for such
an interface on my TS 450.

Can anyone enlighten me ?

Thanks Alan VK5BWG
Alan gilly@camtech.net.au

1721. Icom Desk Charger +

1722. DC and RF Grounding Problem--Severe RFI

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-18 00:00:00 UTC
From: "James F. Chumbley" <chumbley@sj.bigger.net>
Message-ID: <69tnp9$c0r@masters0.InterNex.Net>
Source record: 181274

I have a grounding problem on which I would like a little advice. I cannot get a decent ground. My house is of typical California concrete-slab-on-ground construction and is 1 story high. The reinforcing bars (rebar) in the concrete are not accessible. The only utility or service lines under or in the slab are non-conductive PVC sewer lines.
Water lines are run overhead through the attic. They are copper. Where needed, water line drops are fed down through the walls to the laundry and hot water heater in the garage, the two bathrooms, the kitchen, and the outlet/faucet for the back yard. None of these come within 2 feet of the ground. All lawn sprinkler runs are non-conductive PVC piping. The water supply line from the city water service high-pressure line is rubber hose, really--very strong and buried deeply--but still rubber. (It never gets cold enough to freeze, so flexible rubber is better, since we have earthquakes here.)
The exterior of the house is stucco, and it has the stucco applied over a chicken-wire type of structure. It would be possible to chip away some of the stucco to connect the system ground to the chicken wire.
The AC electrical wiring is three-conductor copper, No. 10 AWG, I believe. It is not aluminum. It is routed primarily overhead through the attic with drops to the outlets in the rooms, although some of the room outlets may be paralleled across short horizontal runs through the walls.
The actual soil on which the house is built was once an orchard. Driving a grounding rod into the soil in a reasonable location would be very difficult because of the way concrete sidewalks have been poured, but it would not be impossible. The length of the run of heavy, braided conductor to such a rod would be about 9 ft. (3 ft. from the rig to the floor, about 6 in. through the wall, and another 5 1/2 ft. over to where the rod would be.)
The TV to and inside the house is cable, run in RG-59U coax, overhead and through the walls. There is no external TV antenna or satellite dish. I am pretty sure that the braid from this coax is not connected to the house electrical system's ground wire. The TVs and VCRs have two-conductor power cords. None of them is grounded. Each does have a place where an RF ground might be able to be connected (either a ground terminal or spare input/output jacks).
Station power here is 500 W. output through about 50 feet of RG-8U coax to a Gap Titan DX mounted with its base about 18 feet up. The antenna is mounted on a steel pole. This mast is not well-grounded, although it does go into the ground a little way. I do not yet have a low-pass filter installed, but tomorrow I am ordering one, which is rated as -100db suppression at 40MHz.
The area, San Jose, California, is a very RF-noisy environment with lots of possibilities for intermodulation product generation.
The primary cause of the RFI seems to be feedback through the AC electrical wiring rather than TV front-end overload. I have put line

filters from Radio Shack on the electrical sockets where the rig itself and each of the TVs is plugged. This resulted in noticeable improvement, but it did not completely eliminate the problem. Radio Shack rates the line filters as UP TO 35db, 100KHz to 100MHz. I would have preferred it to be rated as "at least."

Because of the RFI, I've been off the air except occasionally late at night. I am considering trying these additional things:

1. Finding better AC line filters and plugging the rig's and TV's power cords into them.
2. Running a heavy, braided copper ground buss from the rig's ground connectors to the bare copper ground wire of the house's electrical system. Electronics manufacturers here in this area successfully use this method for making ESD-grounded workstations.
3. Doing the same thing for the TVs. Most of them don't have a dedicated ground terminal, so one would have to be rigged on some of the spare jacks.
4. Running a ground buss UP, rather than down, and attaching it to the (unfortunately isolated) house copper water pipes.

If you have solved a problem like this one, or if you have any recommendations, I would appreciate hearing from you, especially if you have any thoughts in these three areas:

1. Suppliers of AC line filters
2. Achieving a good DC earth ground on this property.
3. Achieving a good RF ground on this property.

Many Thanks,

Jim Chumbley, N6UF

1726. Liberty Net

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-18 00:00:00 UTC
From: nunkhead@aol.com
Message-ID: <19980118212301.QAA03728@ladder01.news.aol.com>
Source record: 181278

I am very shocked to come read this group this mornig and find nothing new on the Liberty Net. Before last night I had never listened to the Liberty net. I
am a 22 male and I have a HAM radio lisc so I figured that I would tune in and see what was going on. I was shocked to find probally some of the same type of folks that helped me get my lisc acting like they where on the CB radio. It was too much. I remember my interest in radio started at CB. It was the first thing I could find. Then after seeing people yelling, swearing, keying up music, noise makers, etc. ripping others antenna's off anothers roof because someone said something that someone didn't like. SO I decided to head for HAM radio and have not been too active due to the huge price tag that comes with HF broadcasting. I have always seen and heard Hams acting rather nice on the air and being very helpful. What i heard last night just plain pissed me off!!!!!!!!! Im sorry but I have NO other way to describe it.

It started off by hearing that this was a net like any other net on HAM radio a bunch of guys LEGALLY checking in to a net. Nothing wrong with that. Ok the subject matter is a little off and not very P.C. "pol. correct" So be it this is America and everyone has their opinion. SO i find no fault in the content of the net at all. I hate P.C to a point as well. If the Net offends you DON"T LISTEN or contact the FCC. The only checked in member that I could find fault with was the homophob that was logging in as a narrow minded dim wit, who had very little grey matter. Matter of fact this same man "which I forgot to get his call, but he was from out in the east coast". This was the only member of the net that I could hear from my listening post that was swearing and threatening another man that was speaking his opinion of this fellow VIC. This guy was like one of the CBers that I listened to when I was 15 years old. He had the attitude of a CBer. The attitude of Im Big and Bad and I'll come and Find you if you Piss me OFF! I kept hearing some threats from the net members as to a certain man that was pissing this VIC fellow off by say "he got his info from God". They were saying how they were going to find where this man lives bla bla bla!!!!!!!!!!!! What a joke! I know that the man was speaking his mind and NOT cheacking into the NET! and YES this is ILLEGAL but under the circumstances of who he was talking to I don't blame him. I find it funny that some of these guys on the net are acting like a bunch of scary thugs on 3950! Im a 22 year old ham and I throw up 405 on bench for a triple with no problem and seeing a bunch of Hams coming to my door with their Fat guts hanging out, their antenna farm cars and an HT glued to one ear is NOT MY IDEA OF BEING SCARED! I suggest that all the people on 3950 shut up or put up! Why don't all of you JAMMERS AND NET MEMBERS MEET and see just how Big Bad and SCARY you all are. If not why not just shut up and stop acting like your on Channel 21 For Christ Sakes. It really is sad because as we speak the HAM Bands are being taking from us everyday. These bands are worth a fortune to the FCC and the private sector. If the FCC and listening Public see the Bands

being used like this it is no wonder why we are Losing the bands! The Hobby is dieing and this is one of the reasons why. Everyone has the FREEDOM TO SPEAK their mind BUT BE ORGANIZED AND ACT like adults not like children on a CB!

My Thoughts A Concerned Ham of the 90's

Body handling: Binary attachment payload not displayed: vcard.vcf

FROM THE ARRL WEB PAGE

Ham: a poor operator. A 'plug.'"

That's the definition of the word given in G. M. Dodge's
The Telegraph Instructor even before radio. The definition has never
changed in wire telegraphy. The first wireless operators were landline
telegraphers who left their offices to go to sea or to man the coastal
stations. They brought with them their language and much of the
tradition of their older profession.

In those early days, spark was king and every station
occupied the same wavelength--or, more accurately perhaps, every station
occupied the whole spectrum with its broad spark signal. Government
stations, ships, coastal stations and the increasingly numerous amateur
operators all competed for time and signal supremacy in each other's
receivers. Many of the amateur stations were very powerful. Two
amateurs,
working across town, could effectively jam all the other operators in
the area. When this happened, frustrated commercial operators would call
the ship whose weaker signals had been blotted out by the amateurs and
say "SRI OM THOSE #&$!@ HAMS ARE JAMMING YOU."

Amateurs, possibly unfamiliar with the real meaning of the
term, picked it up and applied it to themselves in true "Yankee Doodle"
fashion and wore it with pride. As the years advanced, the original
meaning has completely disappeared.

SB DX @ WW $OPDX.340
Ohio/Penn DX Bulletin No. 340

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 340
BID: $OPDX.340
January 19, 1998
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 440-237-8208 28.8k-1200 Baud 8/N/1 (New Area Code!)

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, WB2RAJ/WB2YQH & The 59(9) DXReport, W5FKX, K7BV, K7WX, K9NW, N0TG, 9K2HN, F6AJA & LNDX, FR5DX, G4BUE & DX News Sheet, G4BWP, G4ZVJ, JA1ELY, LX1NO, OA4QV, PT2NP, UA2FZ, VE2EH, VE3BW, VK3RX and ZS6RVG for the following DX information.

3DA, SWAZILAND. The "DX News Sheet" reports Jon, 3DA0CA, is now active on 160 meters, 2100-2200z for OC and JA, and 0245z for EU and NA, on 1827 kHz QSX up 5. QSL via W4DR.

4X50, ISRAEL. Look for this special 4X50 prefix with a /SK suffix to be used until May 1st to celebrate Israel's 50th anniversary.

7P8, LESOTHO. Reminder to look for Dave/ZS6RVG, Dick/ZS6CAL and Mark/ZS6HZ to be active from here between 22nd and 26th of January. Look for them in the normal DX windows signing their homecall/7P8. They state that they will be working SSTV and RTTY as much as possible, but the SSB DXers will also get a chance. For more details, check OPDX.332.

8Q7AA DXPEDITION UPDATE. OPDX InterNet Subscribers will receive an additional bulletin containing the following message by Warren Hill, K7WX, called: "8Q7AA E-mail Feedback"

9G5, Ghana. Andy, G4ZVJ, will be active from here February 5th through March 1st, as 9G5VJ. Activity will be on all HF bands, mostly CW, including the ARRL DX CW Contest and possibly the WPX RTTY Contest. QSL via G4ZVJ (Direct or via Bureau). His direct address: Andy Chadwick, 5 Thorpe Chase, Ripon, North Yorkshire, HG4 1UA, U.K. Andy states that he will accept Bureau requests via the InterNet: andy@g4zvj.demon.co.uk Also, visit his website: http://www.g4zvj.demon.co.uk

AX, AUSTRALIA (Special Prefix). To celebrate "Australia Day" on January 26th, the Australian amateurs will be permitted to use the prefix "AX" instead of VK for the period January 24-26th. The use of the "AX" prefix is optional.

C4, CYPRUS. A group of UA2s operators will be active from 5B4-land during CQWW 160M CW Contest, January 23-25th. Look for UA2FB, UA2FF and UA2FZ as a Multi/Single entry using the callsign C42A. QSL via DK4VW CBA (maildrop only), SASE please, cards then will be forwarded to UA2-land.

CO2, CUBA. Look for Winston, CO2WF, on 40 meters (7050-7060 kHz) between 0200 and 0300z (SSB mode). He is also very active on 14151 or 21215 kHz between 1900 and 2100z. Also, he can sometimes be found on 12 and 17 meters, CW. QSL via VE2EH.

FS, SAINT MARTIN. Dennis, K7BV, will be operating from FS5PL's QTH in the ARRL International DX CW Contest (February 21-22nd). He will also operate a day or two before and after the contest as FS/K7BV, looking for contacts with JA's and others still needing FS. The FS/K7BV QSOs can be confirmed via his home callsign or the K7 bureau. The FS5PL QSL contacts will need to go to Lionel's QSL Manager N0JT. Dennis also mentions he will be operating the 8P9Z station in the July IARU Contest as 8P9**. All QSLs should be sent to his home callsign or the K7 bureau. His address is: Dennis Motschenbacher, 4357 Appollonio Way, Carson City, NV 89704 USA

FT5X, KERGUELEN ISLAND. It has been reported that Rene, FR5HR, now signing FT5X/FR5HR, will be active daily from Kerguelen Island on the following frequencies: 14240 kHz at 0200z (Good opening to the States!), 24950 kHz at 1300z and 18130 kHz at 1400z. Rene will stay on the Kerguelen until the end of February. He can't operate on CW! (He said no permission!). Meanwhile, Helios, FT5XN, has been active on 20 meters (14031 kHz) CW around 0330 and 0400z. QSL via F6PEN.

GB50, ENGLAND (Special Event/Prefix). During the month of June, the station GB50MKI will be active to celebrate the 50 years since the Mark 1 computer was programmed. It was designed in the Engineering Department of Manchester University. The station's HF operations is expected to be active on ALL band, although emphasis will be placed on data modes. Other modes will also be activated. Brief information may be obtained via the Web site: http://www.mcc.ac.uk/Radio/

GU, GUERNSEY. Jean Marc, F5SGI, will be active as GU/F5SGI from April 11-17th. He will be active mostly on CW from 40-10 meters. There will be activity on SSB on 14260 kHz. QSL direct or via the bureau.

HR6, HONDURAS. Joe, VE3BW, will be arriving here February 1st for three weeks. He will be active on all bands, including six meters. He will be active during the ARRL DX Contest, but his contest operation will be cut short due too his departure. QSL to his homecall.

IOTA NEWS.......
Marc, ON5FP, will be active as MW0/ON5FP from St. Tudwalls Islands (EU-106) during the IOTA contest.

The Kuwait Amateur Radio Society (KARS) announces that it will help support 9K2F to activate IOTA AS-118 in the Persian Gulf Group. This DXpedition will take place on February 12th, and will be on the air

for a week. QSL will be via 9K2HN.

KH0, MARIANA ISLANDS. Operators JN1TCC, JS1PNS, JA2HBK, JJ2NYT, JK2TQB and JR4URW will be traveling to Saipan Island and will be active February 14-16th. This will be the group's first ever overseas DX operation. They will use reciprocal callsign like KH0/homecall. Activities will be on 40-10 meters with operations on SSB, CW and RTTY. QSL via homecall.

NOIDXC DXER OF THE YEAR NOMINATIONS NEEDED. Don, W5FKX, President of NOIDXC, reports: "The seventh annual New Orleans International DX Convention will be held again this year at the Royal Sonesta Hotel in the French Quarter on August 14 and 15. Plans are already being finalized on a number of outstanding DX and technical presentations and we are looking forward to another memorable convention. Circle the dates on your calendar and make plans to join us in New Orleans this August. Beginning now, and continuing through the month of February, we are inviting nominations for DXer of the Year. Please send in your nominations on behalf of those who have significantly contributed to our enjoyment of DXing. Nominations for DXer of the Year can be mailed or e-mailed to: Stan Pulitzer, 4236 Vincennes Place, New Orleans, LA 70125 -or- w5jyk@aol.com....."

OA463, PERU (Special Event/Prefix). Cesar, OA4QV, informs OPDX that during the month of January he will be using the special callsign OA463QV to commemorate 463 years (or is it 63?) of the Foundation of Lima (18-01-1535). QSL via OA4QV CBA.

P4, ARUBA. Look for Mike, K4PI, to be active until January 27th, as P49I. His activity includes an entry in the CQ 160 Meter CW Contest. QSL via home call.

QSL INFO AND NEWS......
If you get a chance to work N0TG/VP5, WA4DAN/VP5, AA4VK/VP5 from Turks and Caicos Islands (active until January 23rd on all bands 160-6 meters CW and SSB) send for your "Great Full Color Photo QSL". ALL QSLs "DIRECT ONLY" via N0TG: Randy Rowe, 1094 Big Rock Loop, Los Alamos, NM 87544

PIRATE ALERT! Norby, LX1NO, reports that operations by LX1PS, LX0PAC, LX2AA and LX2BN are pirates. DO NOT QSL! Cards are being returned.

Last call for anyone still needing a QSL from Ron's previous operations of DL4FDU, EY8/NP2AQ, 4L0MR or EK9RM. He requests to E-mail your info, or send QSLs to the address: Ron Maples, U.S. Embassy Mexico City/ESO, Box 3087, Laredo, TX 78044-2087. His E-mail address is: rmaples@compuserve.com. He mentions that he hopes to be on the air from Mexico City by March for the next two years.

Mike, K9NW, reports the following QSL route change for all his DX operations (Effective 1/1/98). QSL the following to WW9DX (direct or bureau): PJ7/N0BSH, NP3/N0BSH, NP4/N0BSH, FS/N0BSH, V47NZ, FS/K9NW and WH7/K9NW. WW9DX is the Western Wisconsin DX Association. Their address is: PO Box 411, La Crosse, Wisconsin 54602. Mike states all

of his future operations will be QSL via WW9DX.

Ron, AC7DX, reports he is NOT (or AA6BB) the QSL Manager for the following stations: JY5IN, T32LN ZK2VE, VS6CT, VS6CT/KP2, BV/OH2BH, VR2BH and VR2EW. OPDX InterNet Subscribers will receive an updated list (as an additional bulletin) for all the stations that Ron handles cards for.

TL, CENTRAL AFRICAN REP. The 59(9) DXReport states Pascal, TL8PL, is still active despite an original January 1 QRT date. OPDX has done some searching and found Pascal was active this past Sunday on 40 meters (7022 kHz at 0515z). It is also reported that he likes the low end of 15 and 17 meters from 1200-1300z. QSL via F5LNA.

TROUBLE IN VANUATU. Alan, VK4AAR, reports to OPDX that a YJ station that he has been looking for several weeks (because he is manager) finally came on the air only for a few moments on January 12th (OPDX has decided not to mention the station's callsign, due to possible repercussions). With an unusually weak signal on 20m, the station said that there is big trouble in Vanuatu at the moment, and he has lowered his antennas (hence the poor signal) as a precaution. The situation is that there is a civil uprising. Alan asked him to stay a minute or two, and he refused saying "I must go QRT immediately!" He sounded quite disturbed, but said he was OK and had survived the big cyclone of recent days. Alan states he has a number of QSLs to reply for this station, but needs to check with him and his logs for the reports. Anyone who is currently still waiting for a reply at this time...please be patient and Alan will get them turned around as soon as possible.

XT, BURKINA FASO. "The 59(9) DXReport" states Mike, F5RLE, will be active on all bands, mostly CW January 22-March 9 as XT2DM.

XW30/XW30A FROM LAOS NOW QRT. This DXpedition received good news during the week in that the authorities in Vientiane had authorized a two day extension to the operation. The DXpedition went QRT on the 16th at midnight Laos time instead of the 14th. This gave many an extra chance to work the XW30/XW30A stations. If you did not work them, you will have another chance later in the year. The Laotians have invited the group back to operate in October. We are sure more details will be forthcoming.

ZX0, ABRA ANTARCTIC DXPEDITION. Paul, PT2NP (ABRA Director Secretary), informs OPDX that the ABRA-DX Brazilian Association will activate its fourth DXpedition, this time to the Antarctic region. From January 22nd to February 8th, operators Lunkes, PT2HF, and Paul, PT2NP, will be active from the Brazilian "Comandante Ferraz" Antarctic Base Station, located on King George Island (counts for DXCC South Shetland Is., IOTA AN-010, DIB-20). Their callsigns will be ZX0DX (SSB) and ZX0CW (CW). They may also use the "Comandante Ferraz" Antarctic Station's callsign ZX0ECF. Besides operating on SSB and CW, they intend to work on RTTY, as ZX0CW.
Suggested frequencies:
SSB - 3755, 7055, 14260, 18128, 21260, 24950, 28420
CW - 3530, 7025, 10140, 14040, 18098, 21040, 24920, 28040

WARC - Operations will depend on taking the proper antennas.
There is a chance of operations on 160m and 6m, if they
can take antennas and equipment for that.
The QSL manager will only be PT2GTI (OK in the Callbook). The cards can
be sent to him directly or via bureau. There may be operations from other
islands near Antarctic Peninsula.

Today, 80m propagation was very good and I could hear to something...
so called "Liberty Net" and MISC.

What a garbage ?

I heard continuous non-sense laughing as well as continuous non-sense
CWs. and someone was sparking "This frequency is designated..... "
oh well...

I thought those foggies went through cleaning process... well...
seems not. 2m repeaters are much clean here in Montreal.

Take care.

I figure your height of eye gives you a theoretical horizon distance of about 185.3 NM or 212.7 statute miles. Add about 5% refraction for your radio horizon and you get 223.3 miles. Of course you would have to be using power, antenna, etc sufficient for the distance. 1/2 watt and a rubber duck might not do the job.

No longer true. The Telecommunications Act of 1996 specifically supercedes and
nullifies all local ordinances and deed restrictions which prohibit rooftop
television antennas in areas where they are required as well as small (DSS)
satellite dishes.

Wake up, Jeffy, and welcome to 1998. It's a much busier and more hurried world these days. For one thing, due to the erosion of American purchasing power, both spouses are often required to work fulltime in order to support their household...which wasn't the case in "yesteryear."

==========
An interesting question. I originally thought that the fee was a one
time fee, but I recall seeing something somewhere that the fee will be
charged again on renewal. Of course, a lot can change over a 10 year
period. Write your Congressman!! Or maybe the ARRL!!!!

Actually, I understand that the fee was supposed to be a "user fee" to
cover the cost of the program. Once the new call is in the data base,
the cost to the FCC of a renewal is no different whether it is vanity
or not vanity.

Back in the "old days" (1960's) all ham licenses other than Novice
licenses were for 5 year terms and cost $5 to renew. (Novice licenses
were for 1 year and not renewable.) Given all of the Congressional
tinkering with FCC, don't be surprised if all licenses, vanity and
non-vanity, become subject to a renewal fee.

I hope I am still around in 10 years to see how it all turns out.

1746. FS: $20 B/O Simpson 360 for parts or may be okay

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-18 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <69s192$a7t$6@csu-b.csuohio.edu>
Source record: 181328

SIMPSON 360 DIGITAL VOLT-OHM-MILLIAMMETER. Bought it and found I could not test it, because it uses a three prong unique sized Simpson extension cord that appears to be no longer available from Simpson (I tried to buy it). It has a battery compartment for battery powered field use, but one of the metal contacts need replacing so I could not test it that way. The point is I don't wish to put any money into it if I can't buy a power cord for it. I wanted it for bench use. I would guess that it does not run, but maybe it does? Probably good for someone who wants a back up parts unit for their Simpson 360. It's a shame, because the thing is a super unit in nice physical condition. Do not have leads or manual. $20 or best offer.

Plus Shipping costs which are not much. I'll pack it free.

-OR- Will take old running complete decent VTVM in trade.

Webcor Regent Coronet Stereo Tube Model #2380-1 reel to reel.
Made in Chicago. Excellent running top-end three speed tube unit
from late 1950's or early 60's with extra features. Has separate
optional Webcor compact mini-suitcase speakers that fold into
little suitcase. Handles 7 inch reels. Has top-end options for
its time. Weighs about 38 lbs by itself. No mikes, missing
small piece of cover plate on bottom about 2"x 3" for access
(Just screw in any plate to cover if you wish), have SAMS
photofacts manual for unit. $100 plus Shipping. Will pack
it free.

Have photos if you wish me to email them to you. Must see.

Will consider trades all or in part for Civilian or Military
tube tester as well -- or guitar or bass amp -- or 486 66Mhz
computer cpu with at least 8 MB ram if you've updated your
CPU to Pentium.

The ITU addressed this matter at WRC-97. Amateurs must limit any
OOB (Out of Bandwidth) emissions to no more than -50 db of the peak
power in the occupied bandwidth on HF, and no more than -70 db on
VHF+. The occupied bandwidth of a SSB emission of a station following
good engineering practice is 2.1 KHz. 6 KHz would definitely be a
violation of the ITU requirement.

ok that much we all know and accept, however not preferred over ssb or
any other mode that is easier

>> "The winners laugh and tell funny stories, while the losers glower and
>> say "Shut up and deal!)

what?
the real problem is this....
YE OLDE FARTZ are pissed off cuz we can do whatever we want as far
as the mode. They were stuck having to learn code and think that
because they were so should we.......NEWS FLASH.....many no coders
do code.....listen to 6m
and 2 and even 222/432. check the call signs that you hear there. How
many have the code test? 1/3 or less...I have checked. SO WHAT you
say? well the point of the matter is that i/we did not have to have
that little paper as you did, and how you flaunt it. I have 30 ghz to
play with, what do I want with a measly little 30mhz?????????????

again

no code does not mean no know code

I was just given a Yaesu FT-209RH 2 meter portable, without the manual
naturally, and I'm hoping
someone out there can either post (email, actually) instructions on how
to do the basic programming,
or maybe a couple of pages from the manual. Anybody help? Thanks.

That was exactly the problem .. Custer was a no coder and the
HH did not have the range to get back to the Fort. Now just
imagine how different History would be if Custer knew code so
he could get on HF and have gotten help ..

>
> Ray, K1XV

In Texas, because they're not considered vanity plates, the annual extra fee for amateur radio call sign tags is $1, and you can have the SAME call sign plate on as many vehicles as you own! Makes for some confusion when running vehicle registration information (I work in public safety communications).

Brian:

The terms "vanity call" and "vanity license plate" did not exist when I received this callsign, in 1977. Such callsigns were then known as "Preferred" callsigns. The term "vanity callsign" came about following the widespread popularization of "vanity" license plates for personal automobiles some years later, and then even later, someone decided to apply the term to ham radio callsigns that were specifically requested.

It is the first ever issue of this callsign, because there was no 10th "zero" district until it was created from the 9th and others just after WW2 and no further 1x2's were issued following that time until the era in which I recieved it.

I *did not* request this callsign when I *did* request a 1x2.
Since "vanity callsigns" are specifically requested by the holder, and since this one well predates the initiation of the term, I don't consider this callsign to be one. It is what the FCC decided to send me.
Your mileage may vary.

I held a 1x3 at the time, and as you know, for code communications at least, "shorter is better".

BTW-- I did, however, request a specific callsign at that time, but it was already taken. What callsign was that, you ask? Well.....W0ET.
Can you imagine?-----

DoubleEwe zero dit dah. CW Nirvana. Alas, it was not to be.

Of course, when the movie "ET" followed a few years later, I learned to count my blessings and be glad some other poor soul got there first.

Presumably the FCC issued me the next open callsign following that which I had requested.

Agreed, while a corporate policy may exist, the legal responsibility still lies with the pilot in command, which according to FAA regs does give him the authority to allow or not allow an amateur transmission aboard his aircraft. Which was my point. You could certainly be
aboard a charter at that altitude, one that may not have the same policys as the bigger commercial carriers.

>
> Mike

There are many others here who can answer this better, but hey, I'll take a shot at it. I believe the reason gain is not as relative is because the desired result is whether or not you can hear the signal by the time it makes it to the speaker, if you have an IF that has more noise than the signal then by adding 60 db of gain you end up with a strong signal that is still below the noise which has also been amplified by 60db, if the IF amp has very low noise then you end up with a stronger recieved signal which is above the noise and thus readable. I found after building a DC reciever that a LM386 is not the BEST choice as an audio amp because of it's noise, and since in a DC receiver ALL gain is at an audio level low noise audio amps are KEY for the best performance. The same principle applys for IF amps, me thinks.

You are still confused. If it is in the cb band, it can't be an HF Ham
frequency no matter what mode you use.
You can operate SSB on the cb band, however there are certain channels
that the SSB operators use and the AM folks will get pretty upset if you
operate SSB on the channels where they normally operate AM. Don't know
what channels are normally use by the cb crowd for SSB, but I think it
is some the upper channels around channel 40.

CLOSED CIRCUIT ADVISORY

The following advisory is not for transmission over amateur radio. This is just a reminder that the address for the Newsline Support Fund is:

Newsline
c/o Andy Jarema-N6TCQ
P.O.Box 660937
Arcadia, California
91066

Again, and as always, we thank you. This ends the closed circuit with Newsline report number 1064 for release on January 3, 1998 to follow.

<*>

The following is a QST

Bad news for growth in ham radio but great news for those planning to attend Hamvention '98. One of your favorites is coming back. Find out who on Newsline report number 1064 coming your way right now.

<*>

Negative numbers for ham radio

The number of applicants being administered Amateur Radio examinations has dropped dramatically. This according to FCC figures supplied to Fred Maia of the W5YI VEC and published in the January 1st edition of his W5YI Report.

The statistics provided to Maia by the Licensing Facility in Gettysburg, Pennsylvania show that there are fewer Advanced, General, Technician Plus and Novice Class operators than there was a year ago. These four classes show a total decline of 2.7 percent in the past twelve months.

And, for the first time, there are less Tech Plus amateurs than in the prior year. This says Maia is proof that the majority of No-Code Technicians are not bothering to learn the More code and are not upgrading. At least not in significant enough numbers to overcome the attrition found among Tech Plus license holders.

Also, the statistics show that the combination of No-Code Technician and Technician Plus hams now account for over 45 percent of all license holders. The percentage of General, Advanced and Extra class is down to 43.5 percent of all licensees. A decade ago in 1987, close to 60 percent of all hams held these higher class licenses.

The only good news comes in the area of code free Technician and Extra class. There are now 18,636 more no-code Tech's than there were a year ago. This says that the entry level license is still quite popular with 1553 newcomers entering the hobby this route every month. The other optimistic news is a slightly higher number of upgrades to Extra in 1997 than in 1996.

But the bottom line is this. Amateur Radio growth in 1998 and beyond does not look encouraging. The FCC statistics show that there are 38.4 percent fewer persons taking Amateur Radio operator license exams now, than just five years ago. The trend Says Fred Maia is clear. The trend is down.

<*>

New Years 6 meter DX

The gods of DX smiled on 6 meters around the world on New Years Eve and New Years Day. This, with what's believed to have been the first ever New Zealand to Texas contacts as ZL2TPY works K5LLL.

But that's not all. ZL3TIC reports via the VHF Reflector working a number of far west W5's and W7's while ZL3NW confirms holding a QSO with K6SIX.

And if that were not enough, DXers in Cuba worked the United States west coast, the mid-west and into the north eastern states while U.S. mainland stations had contact to numerous Europeans, Honduran, Brazilian and Argentine stations. And hams almost anywhere in the United States seem to have been able to work almost everyone they heard.

While most of this activity was found between 50.110 and 50.130 MHz on sideband, the DX was not limited to the lower portion of the band. In Santa Clarita, California, Dave Booth, KC6WFS says that he turned on an old Gonset G-50 AM transceiver to demonstrate ham radio to some visitors. He called CQ on 50.4 MHz and was answered by a station in Oklahoma.

"I couldn't really stay out there a lot of time, but Brent, N5TML was in Echo Mike 84 in Oklahoma. And we talked for about 15 minutes. And needless to say my friends were very impressed." KC6WFS

Several other AM DX contacts followed for Dave.

Even higher in frequency, on the national FM calling frequency of 52.525 MHz, west coast stations report hearing and contacting their counterparts in Georgia, Louisiana, Florida and the Caribbean.

The bottom line is this. If you have any sort of 6 meter rig, CW, SSB, AM or FM, get it out, hook it to an antenna and start listening. Six meters appears to be ready for a DX season that will rival that of 1959 and maybe a lot more. This is because there are many new nations now permitting their hams access to the band and giving 6 meter DX enthusiasts a lot more of the world to work. Even a casual listener with a forty year old Heathkit Sixer AM lunch box has a good chance at working some very rare and exotic DX in the months and years to come.

<*>

Ham Radio to the rescue - again!

Even if the numbers are falling, ham radio public service is still in abundance. And three Franklin Pierce College students may owe their lives to ham radio. This after the three found themselves stranded on New Hampshire's Mount Monadnock in late November after becoming lost in the snow and darkness.

Fortunately, one of the students was Michael Sensabaugh, KB2SSA, of New York. He was smart enough to have a handie talkie with him. He used it to radio for help using the K1TQY repeater in Keene.

According to Richard Seifert, KB2FF, the repeater trustees Dawn Cummings, K1TQY, and Roberta Bennett, N1WTY, responded. Cummings took charge of communication while Bennett called in the alarm to Monadnock State Park

Manager Michael Walsh.

Then, Bennett bundled her young son and her own HT in the family car and drove to Walsh's office. Over the next four hours, she provided a radio link between the lost students and the search party. The students were found late that evening and brought to safety just as more bad weather moved in.

FCC Rep. claims interference is transmitter's fault

An FCC representative is reported to have made some strange claims about interference and the Commission's role in solving it.

According to the Portland SBE Newsletter, Charlene Lagerwerff of the FCC's Wireless Telecommunications Bureau is apparently under the impression that Cross-Modulation and other products of a multi-transmitter site are solely the fault of the transmitting stations. When asked recently about the use of such remedies as circulators, band-pass filters and RF chokes, she reportedly paused a bit and continued on to argue that transmitters are putting out way too much power and interfering with everything.

At the same meeting, James Kaplan, KG7FU, pointed out to her that the ARRL and others have been pushing to make good engineering and design practice the law for receiver manufacturers for years. Also that intermodulation is a site management issue, not a regulatory one.

Milsap returns to Dayton Hamvention

Ronnie Milsap, WB4KCG, is returning for a second appearance at the Dayton Hamvention in 1998. DARA has announced that the legendary country singer will be both banquet speaker as well as the evenings primary entertainment.

Blind since birth, Ronnie Milsap began performing professionally in the 1960's. In 1968, his talents caught the ear of Elvis Presley. Presley brought Milsap in on keyboard for a number of recordings including the smash hit "Kentucky Rain." As a result, Ronnie Milsap became musically rooted to Memphis and Nashville, and by 1970 was already building his own country music career.

Since then, WB4KCG has won virtually every award a performer could hope for including the coveted Country Music Association's Entertainer of the Year Award and Male Vocalist of the Year. In 1983 The Academy of Country Music voted Milsap Best Male Vocalist and he won Song of the Year in 1986 for "Lost in the Fifties Tonight." Ronnie is also the recipient of the only "Gold Braille Album" ever awarded.

To accommodate his performance, the Hamvention has moved the 1998 Awards Banquet to the Nutter Center at Wright State University in nearby Fairborn, Ohio. For more information on banquet tickets add everything else planned for Hamvention 98 visit its website at:

www.hamvention.org

Things that generate RFI

Devices that generate RFI well beyond Part 15 limits seem to be proliferating. According to one industry newsletter, a reader informed them of an air purifier which generates high voltage sparks at 25 to 30 kHz and which then radiates every imaginable harmonic up to about 400 MHZ.

That letter was forwarded to the FCC. In response, the FCC's Ray LaForge wrote that device describe is obviously a intentional radiator. As such the manufacturer should of sought FCC approval prior to marketing the device. However, based on the information provided, it is unlikely that this device would receive approval based on Part 15 of our rules.

LaForge adds that a confidential complaint may be filed with the:

FCC Laboratory
7435 Oakland Mills Road
Columbia, MD 21046

The Commission would then investigate.

(Via Portland FCC Newsletter)

<*>

FCC Certified equipment - General notes

While on the subject of equipment that radiates where its not supposed to, be wary of phony FCC certification stickers. So says the FCC itself in an educational release aimed at making the public aware of how to check the authenticity of a Certification sticker on a piece of equipment.

To find out if a certificate is valid, you can write to either Linda Oni or Charlie Cobbs at the FCC Labs. Ms. Oni can be reached by e-mail to:

loni@fcc.gov

and Mr. Cobb is at:

ccob@fcc.gov

All you need do is to provide them with the printed certification number and ask them to provide name of applicant, frequency, address and telephone number when available. If the certification is a phony, the Commission can initiate a proceeding under Section 510 to confiscate a piece of uncertified equipment.

By the way, the FCC has just released some proposed changes for the marketing of RF devices have just been released on the www at:

www.fcc.gov/Daily_Releases/Daily_Business/1997/db971113/fcc94110.txt

(Via FCC release)

Radio fun in pdx

Smoke and excitement prevailed at two Pacific northwest radio stations in late 1997. In Coos Bay, KMHS on 1429 KHz apparently took a direct lightning hit. According to the stations Chief Engineer Robin O'Kelly, the strike melted coils in the antenna tuning unit, popped the final amplifier tubes, opened the plate transformer, and "unwound" the Power Amplifier tank coils like they were watch springs.

Meanwhile, in Portland, KBOO's 20 kilowatt Collins transmitter fried a plate transformer. It was all smoke but there was no fire. Even so, the transformer was still too hot to touch nearly an hour later.

(Via Portland SBE Newsletter)

<*>

Strawcutter Back

Back on the air without a license to broadcast is the Reverend Rick Strawcutter. The trade publication Radio World reports in its December 24th year end edition that following a self imposed four and half month hiatus, Pastor Strawcutter is again broadcasting his anti government message from his lower Michigan church.

Strawcutter who is WA8RJD did cease his operations last year after a Toledo broadcast station complained of interference. He has now taken up residence on 99.3 MHZ. This is a frequency that Strawcutter claims will not interfere with anyone in the vicinity of the audience he wants to serve.

But the FCC is taking a different view of Strawcutters' 95 watt unlicensed operation. Commission spokesman John Watson says of Strawcutter that he is defiant and continues to do so. Watson refused further comment on what action the FCC might take because the matter is under investigation.

(Via Radio World Magazine)

<*>

San Bernadiono, CA Pirate

And a new pirate is on the air in Southern California. Lyle Henry, K7OO reports that on December 7th at about 10 PM he found a unlicensed stereo station on 91.1 playing mideastern dance music. It was pretty much covering XTRA's Sunday evening Mexican program.

K7OO says that he listened to it from San Bernardino to his home in the Silver Lake area of Los Angeles. That's a distance of about 75 miles. Lyle says that there were some announcements and the station gave 202 area code number. He suspects that the pirate may have been rebroadcasting a satellite feed.

Henry, a broadcast engineer says that the station may be located in the Pomona area. Its also running a good deal of power for him to hear it so well for the distance he did.

(Via CGC Communicator)

<*>

QEX to go bimonthly

QEX, the ARRL Forum for Communications Experimenters, has become a bi-monthly publication but the magazine has expand in size to compensate for the new publication schedule. QEX Editor Rudy Severns, N6LF, says that the total amount of material subscribers get each year would not decrease. Sevrens says that issues will be either 48 or 64 pages depending on available material.

(Via ARRL)

<*>

G3AAJ retires

Ron Broadbent. G3AAJ, retired from the position of Honorary Secretary of AMSAT UK. This, effective December 31st. Broadbent will continue as a member of the Amsat-UK Committee Board of Directors and as its representative to such organizations such as the IARU and the International Space Station planning committee.

The job of Honorary Secretary has been taken on by G6ZRU. In England, Honorary is not a congratulatory term. It refers to being a volunteer and working without being paid.

(Via AMSAT-UK)

<*>

RAC Affiliate Program

Radio Amateurs of Canada has announced a new Affiliated Club Program. The only requirements for affiliation are is that a club application must be submitted to the RAC, the club must have a constitution and that club policies must not conflict with those of RAC. For more information or to apply for affiliation, Canadian hams should contact Radio Amateurs of Canada direct or via their website page.

(Via RAC)

<*>

Philippine Celebration

Across the Pacific, the special event callsign 4G50N has been issued to the Amateur Communications and Emergency Service Club of Naga City, in the Philippines. This, to celebrate Naga City's 50th charter anniversary. This call will be in use from January 1st to March 31st.

(Via press release)

<*>

DX

In DX, the DX News Sheet reports that 9K2ZZ, is once again active from Kuwait. He will be there until December, 1998. QSL via W8CNL, direct only.

And if you were lucky enough to work K4LZE, as MW0BKA from Guernsey between December 4th and 9th then QSL to his home callbook address.

Also, N4GN says that he is handling his own cards from the TF/OH4GN operation. QSL direct to him at:

8309 Dawson Hill Road
Louisville, Kentucky
40299

direct or via the bureau. N4GN adds that the OJ0/N4GN and OH0/N4GN cards are not yet out. Once he gets back to Kentucky, he promises that he will get those done. Meantime, he says thank you for your patience.

And with 10 meters becoming very active, check out the Channel Islands Chapter's "10 10 International." The group holds a popular net every Wednesday at 18:00 UTC and again at 02:00 UTC. Non-members are welcome. For more information, send E-mail to:

rcnoll@ix.netcom.com

(via various sources)

<*>

An RF flash attack

And finally, a citizen of the Georgia Republic says that RF rays from a camera's flash almost killed him. Mr. Aslan Abashidze told local television in the regional capital Batumi that he had made the acquaintance of two people last summer who asked to photograph him. Abashidze says that he noticed an unusual brightness of the camera's flash. A half hour later he began experiencing chest pains. He was taken to a hospital where he was diagnosed as having suffered a heart attack.

Abashidze accused those he calls enemies within Georgia and abroad of being behind a terrorist act to assassinate him, but a leading Georgian cardiologist disagrees. The doctor says that while it was theoretically possible that bright lights might bring on emotional or physical stress that might lead to heart conditions, that this was highly unlikely unless the victim already had physical or cardiac problems.

But Aslan Abashidze wants to hear nothing of what the medical experts say. Instead, he claims that this was the 14th attempt on his life in recent years. Why, he does not say.

CLOSED CIRCUIT ADVISORY

The following closed circuit is not for transmission over Amateur Radio. Just a reminder that the address for the Newsline Support Fund is:

Newsline
c/o Andy Jarema-N6TCQ
P.O.Box 660937
Arcadia, California
91066

Again, and as always, we thank you. This ends the closed circuit with Newsline report number 1065 for release on Friday, January 9th 1998 to follow.

<*>

The following is a QST

Weak signal says that its time to rein in FMers on the VHF and UHF bands and the ARRL Board will consider changes to the DXCC program. These stories and more on Newsline report 1065 coming your way right now!

<*>

Are FM spectrum restrictions needed

Formal restrictions are needed to keep FM users from causing interference to the users of other modes on our VHF and UHF bands. So say the proponents of non FM point to point communications. They are tired of the growing amount of QRM that the growing number of FM users are creating and that its time to protect their interests from FM.

Cross mode interference has always been a problem on any ham band. But now there appears to be an increase in the incidence of both inadvertent and purposeful interference to weak signal, EME, local SSB, CW and even AM contacts on our 2 meter, 1.25 meter and 70 Centimeter bands.

There is also a growing number of new FM users who firmly believe that they have a right to operate anywhere on any band and on any frequency they choose. This, as long as they are technically in compliance with the FCC Part 97 rules. As a result, more and more users of SSB, CW, AM and even some exotic modes find themselves in direct confrontation with FMers. Hams who say that FM should be the only mode permitted to be used on any VHF or UHF ham band. In some cities the situation has gotten so bad that it is almost impossible for non-FM interests to use 2 meters.

Now the ARRL Board of Directors may be getting ready to get involved. On Friday, December 26th, League Vice President Joel Harrison, W5ZN posted a note to the W6YX VHF Reflector looking for input on this topic from the weak signal community.

Harrison admits that the proliferation of FM is becoming a problem in several areas of the country. Harrison says that he is preparing some information on the subject for the upcoming ARRL Board meeting. He asks the W6YX subscribers for any information that they feel will helpful in addressing this matter.

The weak signal community's is divided. Some want mode specific protection written directly into the FCC Part 97 Amateur Rules. Others take a more moderate view. The suggest a campaign to educate every FMer that bandplans exist and must be respected.

What Action the ARRL Board might take to help rectify this situation is unknown but a call by the League for some sort of educational campaign is the minimum that the non FM hams on the VHF reflector expect.

(Adapted from W6YX VHF Reflector postings, others)

<*>

Yaesu on bandplanning

Meantime, one ham equipment supplier is not waiting for the problem to get any worse. Yaesu USA has decided to supply international bandplanning information in revised issues of instruction manuals that will soon begin being shipped with several VHF and UHF radios.

Quoting from the upcoming FT-847 Instruction Manual:

"Please be certain to respect other amateurs by observing the operating bandplans in your country, and do not use the FM mode in the sub-bands recognized as being reserved for SSB/CW "weak-signal" work. These sub-bands typically may include the frequency ranges 50.0 to 50.5 or 51.0 to 51.125 MHZ, 144.0 to 144.5 MHZ, and 432.0 to 432.6 MHZ, but may be slightly different in your country.

Satellite sub-bands to avoid are 29.3 to 29.5 MHZ, 145.8 to 146.0 MHZ, and 435.0 to 438.0 MHZ.

The communications effectiveness of the amateur service requires the cooperation of all licensees, and operating bandplans have evolved so as to minimize interference among operators using incompatible emission modes such as FM and SSB."

Yaesu's Chip Margelli, K7JA says that the frequencies cited were chosen to represent the best compromises between the North American, European, and pan-Pacific regional bandplans. Margelli says that they should make the point most adequately.

(Via K7JA)

<*>

DXCC changes coming

Some major changes will be taking place in the DXCC program if the ARRL Board of Directors accepts and adopts the report of a special study committee. The DXCC 2000 committee was established by the board and charged with redefining the DX Century Club rules for the year 2000 and beyond. Their interim report makes two key recommendations regarding DXCC country status that will primarily impact on those new hams just starting up the DX countries ladder.

In their interim report, the committee recommended changes to what they say are the two most flawed aspects of what determines a countries eligibility for DXCC credit. They have suggested that to be considered as an ineligible country based on government, that any one of three criteria must be met. Either be a member of the United Nations, be a member of the International Amateur Radio Union or possess an I.T.U. assigned callsign allotment.

The committee also suggests a significant change to the minimum size rule. If adopted as presented in the interim report, for an island to be considered a DXCC country it would have to have at least two points separated by not less than 100 meters of connected land above the high tide mark. And this would have to be proven through the use of charts of sufficient scale.

The committees interim report also recommends some changes to the DXCC award structure with two new awards recommended. These are the DXCC Challenge for total band countries on 6 down to 160 meters, but excluding 30 meters. The other is the DXCC 2000 Award for working at least 100 countries during the year 2000.

The ARRL Board will also be discussing this issue when it meets January 16th and 17th in Connecticut. DXers will be waiting to hear the outcome of their vote on this very important issue.

(Via ARRL)

<*>

Cheap illegal radios

More problems on the horizon for the FCC in the area of CB radio enforcement. This as large numbers of cheap, high power wideband radios capable of transmitting AM, FM and SSB between 25 and 32 MHz illegally make their way into the United States.

According to internet news postings, these are radios that are prevented from being legally imported into the country because they do not meet the conditions for Class D CB operation. The manufacturers call them "Export CB sets." They run higher power than allowed in addition to their wide band multi-mode coverage. Now they are now showing up for pennies on the dollar in the Asian electronics marts. And more than a few are illegally getting to the United States.

Rumors are that many are gray market items that have been illegally imported in large quantity. Others come as unwitting tourists buy them as gifts in Asia and have them shipped back to the United States as a consumer electronics item. Somehow, customs is not picking up on what they really are and they get cleared for delivery.

As a result, more and more such sets are showing up on 11 meter CB as well as outside of CB and into the 10 meter amateur band. When combined with the good skip conditions we are having, you can see why they are popular with the Freeband crowd. Also why there may soon be another CB enforcement crisis for the FCC.

(Via various Internet sources)

<*>

Thomas P. Gammon tentatively fined

Still on the enforcement front, word that the FCC has issued a Notice of Apparent Liability for Forfeiture of $18,500 to Thomas P. Gammon. The FCC says that Gammon is the President of Turquoise Broadcasting, Inc., the permittee of Station KIXF-FM in Baker, California and Licensee of Station KIXW-FM, in Lenwood, California. The FCC charges Gammon with multiple ownership rule violations.

(Via FCC release)

<*>

FCC browser access

The FCC has upped the browser requirements to access the Universal Licensing System registration screen. According to Steven Reed of the FCC's Auctions Technical Support Staff, to access the newest version of the ULS, you will need Netscape 4.0 or higher to use the mapping system. If you are not going to use the mapping system, you can use a Netscape version higher than 3.01. Those wishing to register on the ULS may also complete a paper Form 606 and mail it directly to the FCC.

<*>

Club helps handicapped

Members of the Tri State Amateur Radio Association have come to the assistance of a severely handicapped club member. This after mother nature took down his antennas and knocked him off the air.

Club president Raymond Henry, WY2D, tells Newsline that Don May, KC2HV is now back on following repairs to his antennas after a fall windstorm that

hit over 60 miles per hour. The wind gusts were so severe that May's VHF and HF beams were down and his 80 and 40 meter dipole was ripped apart.

May is a double amputee, having lost his legs to diabetes. But his disability has not stood in his way of enjoying ham radio. He is a member of ARES, RACES and was active in MARS. Don is also a member of the Tri State Club and was very active as an officer.

<*>

Houston Net Celebration

January 6th marked the 200th time the Houston AMSAT Net has been transmitted over commercial satellite. You can enjoy the net if you have access to a KU band satellite receiver. Tune it to the Hughes SBS 6 satellite on Transponder 13 B, with 6.2 MHZ wide band audio. If you don't have a satellite receiver but do have a computer with a sound card and real audio software you can get an audio feed at

www.amsatnet.com

(Via KK5DO)

<*>

Sputnik PS2 dead

Reports from around the world appear to confirm that the Sputnik PS2 mini-satellite has stopped transmitting. The beacon signal from the working model of the original Sputnik 1 satellite was last monitored on December 29th or 30th. The battery powered 200 milliwatt transmitter had continued working for eight weeks after its launch by hand from the Russian Mir space station on November 3rd, transmitting a beep-beep tone on 145.82 MHZ.

(Via ARRL, AMSAT, others)

<*>

ARRL honors NASA SAREX commitment

The ARRL has honored NASA for its commitment to youth and to ham radio. This, when General Counsel Chris Imlay, W3KD, presented a plaque from the Leagues' Board of Directors to the space organization in late December.

The plaque thanks the agency for giving Amateur Radio its many opportunities over the past seven years to involve youngsters in educational activities through the Shuttle Amateur Radio or SAREX program. It was presented to NASA Director Dan Goldin and NASA Headquarters education officials.

(Via ARRL)

<*>

RAC Foundation

On the international scene, word that Canada' Manotick Amateur Radio Group, a small but active club with about 30 amateurs south of Ottawa, is the first to make a donation to the New Radio Amateurs of Canada Foundation. In a letter to RAC General Manager Debbie Norman, the club's secretary treasurer, Jim Devenny, VA3HL, presented the national society with a check for $220 Canadian. He has challenged all amateur radio groups and clubs, large and small, as well as individual amateurs, to follow the clubs' lead by contributing to make the RAC Foundation a great success.

(Via RAC)

<*>

RAC seeks views on callsigns

The Callsign Working Group, a joint Industry Canada and Radio Amateurs of Canada has filed its report with the Canadian Amateur Radio Advisory Board. This report deals with the policies and procedures that may be used in the future administration of Canadian Amateur Radio station callsigns.

Radio Amateurs of Canada has been asked by Industry Canada to seek the views of amateurs concerning this important report. RAC says that it will welcome comments and responses to the callsign report by Canadian amateurs before making any formal proposal to Industry Canada.

(Via RAC)

<*>

DX

In DX, The "DX News Sheet" reports that PB0ALB, is planning to be active from Malaysia for six weeks in April and May of 1998 as 9M8CB. Activity will be from Serian on all bands. QSL direct to PB0ALB.

And F2HE, will once again be active as FG/F2HE from the French Guadeloupe island of Les Saintes between February 1st and the 15th. QSL as directed on the air.

FT5ZG has been showing up from Amsterdam and St. Paul Islands on 20 meters around 14.278 MHZ between 15:00 and 16:30 UTC. Sometimes there is a list operation being taken by F5PFP. QSL via F5RQQ.

And the Coast Guard is transferring N2NL to Guam. Dave says he will be there for at least 2 years and hopes to be active as N2NL/KH2 sometime in the spring. He will operate mostly CW and will be active on most bands and in contests.

(Via various DX sources)

<*>

DX names in the news

The North Jersey DX Association has re-elected its incumbent officers to serve for another year. They are President Ben Friedland, K2BF; Vice President John Sawina, NA2R; Treasurer Gene Ingraham, N2BIM and Secretary Bill Hudzuk, W2UDT.

(Via press release)

<*>

KD4WUJ garners 3 Grammy Nominations

And congratulations to country entertainer Patty Loveless, KD4WUJ on her three Grammy nominations. Patty has been nominated for Best Female Country Vocal Performance, Best Country Vocal Collaboration and for her hit album "Long Stretch of Lonesome."

(Via press release)

<*>

Lost and found doggie phone

This from London: The January 2nd edition of "The Sun" newspaper tells the story of a British woman who lost a surprise gift for her roommate. A cellular telephone.

Rachel Murray left the gift under the Christmas tree. Later she found only a pile of torn paper. She immediately suspected that friend Tony Dangerfield's bloodhound, Charlie, was the culprit.

So Murray started a frantic search of their flat. She found nothing but figured that if the phone were somehow turned on, she could dial the number and hope to hear it ringing. So Ms. Murray obtained the number from the telephone company. She dialed it and heard muffled ringing from ... sleeping Charlie's stomach.

At first she thought Charlie was lying on the phone, but then realized where it actually was. So the dog was rushed to a vet for treatment. He told Murray and Dangerfield to let nature take its course. 24 hours later, Charlie was just fine. If you are wonder about the phone, it works just fine too!

[1066]

Newsline report number 1066 for release on Friday, January 16th, 1998 to follow.

<*>

The following is a QST

KB6LQS aborts his attempt to balloon around the world and Canada warns its hams not to violate American radio law when operating in the USA. These stories and more on Newsline report number 1066 coming your way right now!

<*>

Global Hilton fails

American aviator Dick Rutan, KB6LQS and his companion Dave Melton have been forced to abort their around the world balloon flight and parachute to safety. This after a tear developed in the helium compartment of their Global Hilton balloon about an hour after takeoff from Albuquerque, New Mexico on January the 9th.

Two balloonists abandoned their round the world flight just 100 miles from where they had taken off. The then unmanned balloon touched down but bounced back up to 30,000 feet and continued to drift for hours before deflating enough to crash in Texas.

Both Rutan and Melton are now reported to be in good condition after landing 11 miles southeast of Vaughn, New Mexico. Rutan suffered a bloody nose from cactus needles. Melton had to be airlifted to an Albuquerque hospital after striking a cattle fence as he landed. Later reports said he dislocated a hip.

At air time, its unknown if Rutan and Melton will try the record breaking flight again at a later date.

<*>

CB and Ham Radio helps in northeast ice storm

A record shattering ice storm paralyzes the northeast U.S. and radio amateurs are on the job helping disaster agencies.

Hams throughout the Northeast respond to an ice storm emergency that left millions of Americans and Canadians without power. The storms's massive power and telephone outages hit hard in New York state, north to the Canadian border, west as far as Watertown, and east to Burlington, Vermont. Widespread power outages were also reported north of the border, with as many as 3 million residents in Southern Quebec affected.

A state of emergency was declared in at least five upstate New York counties. National Guard units were dispatched to hard-hit Plattsburgh January 9th to assist with relief efforts. In Waterford, New York, 50 homes were evacuated where the Mohawk and Hudson rivers meet. From there Kevin Clark, WA2AEY reports that hams in and near Watertown were involved in relief efforts.

"Our amateurs radio operators up here have been doing a great service to the general public up here by helping maintain communications between all the different shelters. A lot of the shelters are in public schools. Our local high school has something like 700 people in shelters there now. And all the surrounding areas, a lot of shelters are set up in volunteer fire halls in all kinds of communities around here." Clark

Clark says nearly 7,000 people were in emergency shelters throughout Jefferson County. He says that the only repeater up and running was 147.375 and that many hams were helping with emergency communications.

"Two meter FM is carrying the majority of the emergency communications for the amateurs around here. And I would say being supplemented by 75 meter sideband nets." Clark

The storm has also taken its toll on antennas. Clark says he has seen many ham antennas down and thinks it will be a miracle if any are left standing. Several large commercial communications towers were also destroyed.

ARES members in Albany County were activated January 8th to help the American Red Cross. April Stack, KA2QIG, reports that a local emergency net was operating on the 147.12 MHZ repeater, while neighboring Schenectady County ARES ran a flood watch emergency net on the 147.06 MHZ repeater.

The 145.39 Mount Equinox, Vermont, repeater was also used to relay information to New York's northern counties when HF cannot be utilized. HF communications began January 8th on 7255 kHz, and later moved to 3993.5 kHz.

Hams were stationed at the Albany, New York, Red Cross Chapter House, the National Weather Service in Albany, and at the New York State Emergency Management Office, as well as at designated sites along the Mohawk River. Hams were keeping in contact with Red Cross officials in Plattsburgh. Damage assessment was expected to continue at least for a week.

Albany County operations were by ARES Emergency Coordinator George Odom, KB2SIY. Fifty ham radio operators who are Civil Air Patrol members from downstate New York State were summoned to the stricken area. They acted as relief communicators for ongoing CAP search operations.

Nor are hams alone in providing assistance to the stricken area. In Maine, the Road Watchers CB Club has been active. Club members searched rural areas on foot looking for stranded motorists, broken power poles and damaged transmission lines. The CBers found over a dozen victims and counted over three hundred poles and several power transmission towers that had fallen under load of ice.

Canadian warning

A warning to Canadian operating in the United States. Do not operate out of band when visiting the lower 48.

That alert comes Radio Amateurs of Canada. RAC is the Canadian national Amateur Radio Society. It issued the warning after being advised that Canadian amateurs visiting the south-east United States have been heard operating portable and mobile on 75 meter SSB between 3.725 and 3.750 MHZ. This says RAC is a violation of United States Part 97 rules.

Radio Amateurs of Canadian warns all foreign amateurs including Canadians who intend to operate in the United States that they must comply with United States radio regulations. This says RAC includes sub-band

restrictions.

United States amateurs are not permitted to operate on phone below 3.750 MHZ. Neither are foreign hams who are visiting the USA.

Vanity Gate 4 Apps flood FCC

The flood gates have opened to Gate 4 of the Vanity Callsign program.

As expected the FCC opened Gate 4 on Thursday, January 4th issuing approximately 600 new amateur Vanity Callsigns. The FCC reports that during December it received 497 paper applications along with 1873 electronic applications.

In addition to the 600 Gate 4 Callsigns issued, the FCC assigned an additional 300 Gate 4 applications to the work in process file and all of those have been processed.

The FCC issued an additional 79 Gate 4 Vanity Callsigns on January 8th. The FCC began accepting Gate 4 applications on Friday, December 2nd.

FM reacts to weak signal

Amateur Radio FM interests are already vowing a fight to keep access to all the VHF and UHF spectrum that they now have. This following last weeks report that non-FM interests on the VHF and UHF bands may seek restrictions on where FM can and cannot be used.

The non-FM'ers say that the users of the fun mode are ignoring established ARRL approved band plans. That they are popping up wherever they please and destroying the ability of other hams to enjoy their modes.

But some vocal FM'ers say that it's the utility of FM in day to day communications that makes it so valuable to every ham. This, regardless what frequency is being used as long as its one that's legal in the FCC's Part 97 rules.

Other FM enthusiasts are going a lot farther. They are saying that they did not write the bandplans, that they are not members of the ARRL and that they cannot be forced to abide by them.

The ARRL Board of Directors is expected to at least look at the problem of FM incursion into what's traditionally been non-FM spectrum at it holds its first meeting of 1998. That conference is taking place as we go to air. We will have a full report on this and other board actions, next week.

Metroplex at 20

The Metroplex Amateur Communications Association is celebrating its 20th anniversary. The club operates repeaters in the greater New York City and Northern New Jersey area. According to club president Alex Magocsi, W2OV, this makes Metroplex one of the nations longest surviving repeater oriented radio clubs.

"We roughly have 40 percent of the membership in New York state, another 40 percent in New Jersey, the state of New Jersey and the last 20 percent spread across the United States. And above 8 percent of that across the rest of the world." Magosci

Magosci says that Metroplex recently signed up its 803 member making it the second largest amateur repeater club in the United States. Metroplex was also one of the first clubs to sponsor a remotely located Newsline telephone feed. It did so for several years back in the early 1980's.

(Via Newsline and Metroplex)

<*>

Digital linking

And speaking about FM, the editor of CQ VHF magazine is interested in contacting hams who are using digital audio communications to directly link two or more FM voice repeaters. We are not talking about repeater links that use Internet Phone on the world wide web. Rather, Rich Moseson, W2VU, is interested in hearing from any hams who convert their repeaters audio into a digital datastream and then modulate an RF carrier with that data for repeater linking purposes. If you have been successful in using this technology or are even experimenting with it, please e-mail him at:

w2vu@aol.com

<*>

MARS changing with the times

MARS, the Military Affiliate Radio System is changing. It may not be using Morse code very much these days, but it is keeping up with the times.

"Any other affiliates on frequency? ..."

That's the man from MARS. Ed Woods, is known to his Hoosier ham friends as WD9DVA. But today he is working the low bands, making phone patches.

Ed is one of several dozen amateur radio operators across the country that operate on special frequencies set aside for Air Force Military Amateur Radio. Even with todays modern communications, these dedicated hams spend costless hours passing health and welfare traffic for America's Military.

"Until Desert Storm we never had air to ground phone patches. It was always point to point. In other words, we would phone patch into the states from Germany, from Vietnam, from the Philippines, from Hawaii, from Greece, various places like that." Woods

"This is Bruce calling from over the Caribbean at about 20,000 feet and just wanted to let you know that we're back at home around 5:30."

Another GI able to phone home.

Thanks to the changes in military regulations, its now even possible for a GI to reach out and touch someone at home while flying over the oceans.

DARA nominations open

The nominating period for the Dayton Amateur Radio Associations' Radio Amateur of the Year, Special Achievement and Technical Excellence Awards is now open.

The Radio Amateur of the Year is awarded to the person who has made a long term or lifelong commitment to the advancement of amateur radio. The Special Achievement usually goes to an individual who has spearheaded a single significant Amateur Radio related project. The Technical Excellence is for the person who has provided outstanding technical advancement in the field of amateur radio.

No special nominating form is needed. Simply send letters of nomination to:

Hamvention Awards
P.O.Box 964
Dayton, Ohio 45401

(Via Newsline, DARA)

<*>

Nominations open for Maxim Memorial Award

The nominating period is also now open for the ARRL's annual Hiram Percy Maxim Memorial Award. The award is given annually to the licensed radio amateur under the age of 21 whose accomplishments and contributions are of the most exemplary nature within the framework of Amateur Radio activities.

Formal nominations are made by Section Managers. Supporting information, including the endorsement of ARRL affiliated clubs and elected or appointed League Leadership officials, should be submitted with the nomination.

Nominations should be sent to the Section Manager who must forward them to ARRL Headquarters by March 31st. There is no limit to the number of nominations one may make.

<gareth@capecod.net> writes
>Just curious what various operators think. Should stations do
>everything possible(within financial reason) with respect to general
>station setup and engineering, to confine their SSB signal to a 6 KC
>spread?
>I have always thought this was part of good operating proceedure,
>however, some of my recent e-mail would lead me to the conclusion that
>this is no longer considered true.

I Completely agree,
The 6kc 'rule' seems to be laughed at by (far too many)
eastern european operators especially, every year more and more people
set up station and eventually we are going to run out of space.

A friend of mine is into CB (gulp) and even he commented how close and
bad mannered some Hams can be - *even* CB users seem to operate
every 5kc's or so, ... now *thats* a bad omen.

I am disgusted at some stations, honestly,
i'm not saying i'm a perfect op, ' cause i'm NOT,
but the illusion of friendly Hams
is fast disappearing .... many stations just end up turning up the mic
gain etc and ** have ** to be the loudest signal on the band.

It seems to be an ego thing - like 'my computers better than yours' type of
thing.... sad,.

these stations seem to be just showing off, how much
equipment they can afford to buy, and demonstrating a lack of
knowledge and skill in operating it. and just trying to put down
smaller operators, as a sort of ego - trip and that really
has no place at all in Ham Radio. at all.

Sorry if i seem to have got up on my soapbox, but it does seem that theres 2
types of Hams ..... ones who care about Ham Radio, - for what it is,...
and others who dont think about Ham Radio ... but i may be wrong :))

Hi Mark, I do believe all those "bozos" are coded HF hams. I have never
heard anything on CB as bad as the Liberty Net. I personally wish we
could replace the Liberty Net with a few pedal-to-the-metal CBers.

Hello, I'm looking into getting a couple of portable radios for use in climbing. I tried some of the cheap Radio shack ones and they didn't last long and the headset keep getting knocked off. Right now I'm looking into one of the Motoroa handhelds...I have seen in a couple of movies that the actors (cops or miltary) had something that looked like a throat mike, elastic band thing with a ear piece that fit inside the ear with a small clip on the outside of your ear lobe to keep it in place. Does something like this exist? I'm guessing that real life police/miltary have something like this and it would be able to take all kinds of weather and/or abuse. Any pointers, suggestions would be greastly appreciated. Please respond directly to djd@u.washington.edu. Thanks.

Rest assured that the vanity program was intended in large part as a
revenue generator for the FCC. So of the $50, only part covers the cost of
administering the program. Stands to reason they will want the revenue
upon renewal as well.

Same thing with vanity licence plates - even though they only stamp 'em
once.

Not sure exactly what you are asking here. The 23 channels in your cb
radio are cb frequencies, not ham frequencies, and you can use it there
just like any cb radio. Your ham license has nothing to do with
operating on cb.

REPLY...

You can use your CB radio to transmit, with SSB, in the HF Citizen's Band.

You just cannot use your Amateur radio license to transmit, using that same mode, in the HF Amateur bands.

Ironic, isn't it? You have more HF privileges using a CB then you do with a Technician class license in Amateur radio.

1778. Re: Digital modes in Novice subbands? Why?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-19 00:00:00 UTC
From: n8blk@aol.com
Message-ID: <19980119211100.QAA20421@ladder01.news.aol.com>
Source record: 181145

In article <69thum$ceh@sjx-ixn4.ix.netcom.com>, au@ix.netcom.com(au) writes:

>I've heard 40 meter packet stations take over the bottom 5-10 khz of the 40
>meter Novice subband lately. Now after tuning through the 80 band, there is
>a loud (in Oregon anyway) new mode on 3700 which is dead center of the
>subband. The Novices only have 50 khz to begin with on each of these >bands.
>Has it become common practice to operate within the Novice bands?

First, if you're hearing hams outside the U.S., there is no reason to
expect said hams to have any knowledge of U.S. band limitations. Second,
for the most part, the novice bands in the U.S. aren't limited to A1 signals,
so other lawful signals by hams can be sent if not interfering with other
lawful signals. Third, the novice bands are not heavily used anymore, and
all of that bandwidth is going to waste otherwise. Fourth, this is a society
which has an attitude that if it doesn't negatively affect me, I'm going to
do it, even if others suffer. Thus, even if a novice or technician plus
licensee
in the U.S. does suffer, there is little that can be lawfully done. Of course,
with DSP processing, most such digital signals can be easily gotten
rid of if you want to use A1 in the novice bands too. At let's say 8 wpm,
it's easy to filter out digital signals not directly on your frequency, or use
a narrow bandwidth filter to do much of the same.

I'm not sure there is a perfect solution. Perhaps, novice bands will be more
heavily used as HF frequencies get better propagation, and it will become
more difficult to take over the novice bands with a digital signal, or
alternatively,
the ARRL suggestion that the novice bands disappear will be implemented, and
digital operators of one kind or another will have access to that
bandwidth unimpeded by having to consider cw. Either way, it's doubtful
that appeals to agreements, or good sense on the part of hams will solve
the problem. Have any doubt, listen to a dx pileup for an Italian amateur!

> >
> > What FCC regulation says I can't transmit from an aircraft or other at 30,000 ft?
>
> Try FAR Part 91.

Ok, but my question was what FCC regulation says I can't transmit? You referred me to an FAA regulation, which clearly describes that the determination of paragraph (b) (5) shall be made by the PIC. Since I'm the PIC I have determined that my HT will not cause interference to my navigational or communications system on the aircraft, VFR or IFR. Do you interpret this another way?

Tim, ka8ddz

From FAR Part 91

Sec. 91.21 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.
(b) Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or

communication system of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

1780. 2 meter FM simplex ops off channel

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-19 00:00:00 UTC
From: pruth@alpha.cc.oberlin.edu
Message-ID: <6a0f98$ejk@news.cc.oberlin.edu>
Source record: 181147

This is not a grave problem, just a peeve, that happens enough to be annoying: 2m FM simplex ops who ragchew 5-10KHz off the channel. I'll be monitoring 147.525 in my home state, Ohio, which has 15 KHz channel spacing, and hear squelch breaking from time to time when other Ohio ops ragchew on 147.520, which is 5 KHz shy of where they should be, in Ohio. I know there's yet to be any uniformity of channel spacing, with neighboring Michigan having 20 KHz spaces, and I feel sorry for 2m ops near the OH-MI border. I've tried to tactfully mention to the offending ops that they're 5 off but they refuse to change their ways, one saying there's no law that says he can't be off-channel, and of course he's right. This happens in other places on 2m, where ops seem to land willy-nilly on a freq and set up camp, to the annoyance of those using channelized freqs the way suggested by the Gentlemen's Agreements. Any advice on how to go about persuading these ops to bump it up, or down, as the case may be? I suppose we could move our ragchew freq and avoid the problem that way, but darn it! what's wrong with these people anyway? Thanks for listening, I feel much better, and it could be much worse--it could be Southern California :^) --Bill KB8USZ william.a.ruth@oberlin.edu

Hi Jeff, it was obvious that his choice of words was not accurate. I offered one
possible explaination. Here's what he was trying to say.

>> what I was trying to say: many people take one month to learn morse
>> and if I can do it in one day, why should I get blamed ?? why
>> should I get blamed if I can complete my advanced in three days ?
>> I am sorry, but I am as slow as you are.

I quessed wrong - It was a rhetorical question - *If* he could learn Morse code
in one day then ... It was the same question that I asked previously. Am I
an undesirable member of the ARS because I passed the advanced exam on a whim one
day in San Francisco without any effort or studying and without opening a book
of any kind?

Thanks for the info regarding antenna aperature. I get to add some theory to my practical skeleton. :) I enjoy playing with antennas and have come up with some crazy designs, but this is what I have tried so far with antennas and it seems that there must be something else to it. I have experimented with and Alinco DJ-560, Yeasu HT (also dual bander), and an FT-5100 mobile (all radios are dual banders). For antennas I have used the stock antenna for the yeasu HT, an 11 in. dual band rubber duck, a Cushcraft dual band mag. mount mobile (approx. 5/8 on 2m), Pro Am dual band mag. mount mobile (approx. 1/4 on 2m) and a homebrew 440 stacked vertical consisting of a J-pole with three extra 5/8 wave elements stacked, (It is one long wire with the fed end as a J-pole, then 3/8 wave length of wire bend horizontally then a 5/8 wave vertical element, repeat this 2 more times. It is a modification of a high gain stacked 2m j-pole plan I saw in the antenna handbook. Total antenna length is 5-6 ft.) and a 5/8 over a 1/4 wave 2m (about 7ft. long). Unfortunately I can only guess at the radiation patterns for my antennas.

When I tested 2m and 440 in the World Congress center we used the dual band HTs, one stock rubber duck and the 11 in. dual band rubber duck. So the antenna aperture was

the same for both bands. 2m performed significantly better. Enough so that it could not have been attributed to happenstance.

I have experimented with the homebrew 440 and a dual band mobile. (ie drive around and try the different bands) 440 hardly would make it 1 mile. 2m 5 mile or more. Between cars the band performance has been similar. (two dual band radios and dual band antennas)

My experiments are not well designed, but they have been generally convincing to me. The unknowns are the radiation patterns of the antennas (but usually the 440 antennas should have had more relative gain (ie more elements) compared to the 2m antennas). I also don't know what kind of performance loss is incurred when using a dual band antenna. Also maybe the radios have radically different sensitivity for each band, but I think not.

> >With that in mind, how do the other bands measure up?
> >10m FM, 6M, 2m, 220, 440 and 1.2G
>
> The *physically* bigger the antenna, the less "path loss" it will have.

> 1.2 GHz *transmit* antenna will put more ERP toward the horizon.
> Couple that with the now equal aperture of the receive antennas,
> and the higher frequency works better.)
>

In mountainous areas wouldn't the lower bands perform better? I want the signal to bend over the ridges and bounce into the valleys. Don't higher frequencies tend to be more absorbable and less bouncy and bendable?

Thanks!

Hello, All!

I am radioamateur, and I buy used FTH-2010 some times last. For programming subj on amateur frequencies I can use only cloning method, because a not have soft and interface cable for programming from computer. May be You know any info about this ? I can buy soft and interface cable scheme(or Service manual) at small price (exchange also possible- russian power tubes,components,software etc.). I live in Minsk, Belorussia . Need any information about subj. who can help me? Please, e-mail me on stas_d@chat.ru Best regards and beforehand thanks!

Hi Cecil. Yep they are coded hams and so are the bozos jamming them. I don't know about out where you are but if you tune around 11 meters in these parts you are going to hear the same garbage with many times the number of operators. Heck they make the lib net sound like a church social. I really think that the effort it takes to learn CW and pass the code test tends to weed out a lot of the sorts we hear on 3950. But like with any group of people we have our bad apples. Maybe the CW issue does need to be addressed but before we do, lets get some way of getting the garbage off the air that is there now and some way to keep it off later if we get a flood of new ops from reduction in CW requirements. I am not saying that new hf no-code ops will all be bad ops but I do think the percentage of bad ops will go up. Maybe just because of the numbers. But also because the privileges will be easier to get so some folks will abuse the privilege.

I don't think you can transmit by using old CB rig.

... there was no radio license 200 years ago... so is it possible to
transmit anything today ?? no... same concept.

I heard that signal last nite for the first time, and it was very loid here in Colorado, too.

Because that portion of 80m is sgared with point-to-point stations in So. America, I assumed it to be commercial. I know that I didin't recognize the mode.

Most of the AM activity(legal activity!) is clustered at-and above- 29mHz, as you noticed. 29mHz would be a good calling freq.

As most of these oprs are OT's, they do some tuning around their calling freq., so its less important to be exactly any freq.

Ah, another Lockout Lid. Thanks ever so much for helping to kill ham
packet radio.

You'd be more than welcome to post any inane remark, personal attack,
religious comment, or cookbook recipe on our system. You could even
advertise a CB set, modified or otherwise. Thanks in large part to
people like you, however, the network is in such bad shape that you'll
probably never get the chance to do so.

The "shadows" are much deeper from a blockage as you go up in frequency.
Our Explorer Post sponsors two repeaters at the same exact location, at
the same height, on the same tower, with the same ERP. This site is on
the south end of Phoenix. When in back of the mountains on the north
end of town, the shadow is 12-20 dB deeper, and extends further from the
blockage. This is the major problem to contend with in this area, as we
don't have too much dense foliate here to worry about. Sahuaros don't
take up much space.

Hello,

I'm looking for someone who would be willing to copy and mail a series
of articles that appeared in CQ Magazine back in 1981, 1982. Will pay
for copies and mailing expenses.

The four articles are:

July 1981 - Product review of the Gem Quad Antenna
August 1981 - A Primer: The Cubical Quad Antenna
December 1981 - " " " "
April 1982 - " " " "

I appreciate your help and thanks for reading this message.

The last I knew, my radio doesn't have channels. And, my license allows me
to transmit anywhere between
144 and 148MHz. That means if I want to transmit on 147.523323232,
I'm within my operating privileges to do so.

As usual Cutie Boy is clueless, he is however very entertaining. Your amateur status has nothing to do with using the CB as intended on the CB bands so talk away and enjoy. You'll need to upgrade to at least tech plus if you want to move it up into the ham bands. There is alot of information available about converting CB's to 10m, if you have one that runs SSB it would make an excellent candidate for conversion.

No, it's in the CB band Bill so there is really no connection to amateur radio at all. Your still transmitting on the regular 'channels' just without a carrier and one of the sidebands removed hence single, sideband. You would only be concerned about ham frequencys if the rig had the ability to go above 28.000MHz or it had been converted to operate there.

So what do you do to combat the problem? The normal: climb on to a ridge, use the other repeater or ...
What frequencies are the two repeaters? What do you use for communication when you are in the backcountry?

Yea, we should all mail bomb poor TV Guides email adress because of a silly mistake in a crossword puzzle. Perhaps if they get enough hate mail they'll do a nice story about amateur radio, mabye they'll call it "Hams who Hate".

Great idea....

No irony at all. They're two very different services. If he had
a Marine License, he could transmit on any maritime freq'y between
2 and 28 MHz. That service has nothing at all in common with the
ARS.

You seem to confuse CB and ham radio - that appears to be a common
occurance among folks such yourself.

Of course, your error is in neglecting the fact that a tech license
is for V/UHF operation only; you should focus your attention on the
almost 130 MHz available between 6m and 23cm that comes with the
tech license. So much, for so little effort.

As the PIC you can make that determination, however on a commercial aircraft, since that is what the original thread started out as, you are not, therefore should the "company/PIC" decide not to allow, as is the case, you may not. Hey, if you have your own personal aircraft that can cruise at 30,000 feet, why are you so concerned about what can or can not be done on a commercial aircraft anyway???

Hi Bill, SSB is legal on the CB frequencies and gives one approximately four times the talk power for the same power output. Trouble is, the great majority of CBers use AM=DSB+Carrier and their transceivers don't have a BFO so they cannot copy your SSB signal (which might be an advantage).

WELLL EXCCCUSSSEEEE MEEEE. I apologize to amateur radio for killing it
off. Gee, to think there are only 20+ other systems in the loop in the
NY-NJ area. Didn't know it was the g_d given right of assholes to access
MY equipment and dictate to ME on MY equipment what they should be
allowed to post. Quite frankly, packet is being killed off by the
Internet Glenn or haven't you been paying attention...poor form old man

Quite frankly, I never saw the amateur radio packet system as a free
forum anyway. What I choose to allow to be posted quite frankly won't
make a difference whether or not the system survives. However, if more
people think like you then all you end up with is paying the electric
bills for the likes of Drew and Burt and scum like that. Personally, I
choose not to and if that bothers you...that's life.

Yes, they are screening - as the sysop's spare time permits. This is
why packet is slower than snail mail - if the packet ever gets through
at all.

Whoops, Your wrong about the use of the Laptop. Except during take-off and landings. I fly a lot, and me and 70% of the other passengers are using our laptops most of the flight... Delta, United, etc.

Perhaps there was a total of 30K without taking away the
hams that didn't renew. In other words, 30K minus
the 22K hams (SKs, etc.) nets out only an absolute
gain of 8K.

The W5YI report is direct from the FCC database too.

Assuming this post isn't a troll,
answer is no, as most spam is commercial in nature. And ham radio
communications are to be non-commercial/ "no pucanary(sp) interest".

Besides, most sysops review packet postings before releasing them for
distribution, to protect their license and the system.

Folks, I have been involved in radio since 1959. This is a disgrace!
While I blame the culture we live in for producing such individuals,
I fear for our hobby. Both sides are wrong. Using the radio waves
for political purposes. All this will do is cause congress to do to
us what it has done to gun owners. Remember the attempts to ban
scanners?

We must clean up our act.

Hi.

Just rememberd that some years ago I worked a U.S. station on 29MHz AM. It was somewhere just above 29MHZ I think. Anybody know if there is any special calling freq that is used for AM on 29MHz? Also wish to know if there is any freq's that is used (channels). Just wounder as I got a old CB radio with only AM that i tought I would mod to be able to get some use of it. There is a 10kHz space between the channels so wish to know if I should put it to even 10 or 5kHz (e.g. 29.000, 29.010, 29020 OR 29.005, 29015, 29,025).

/Anders

Just rememberd that some years ago I worked a U.S. station on 29MHz AM. It was somewhere just above 29MHZ I think. Anybody know if there is any special calling freq that is used for AM on 29MHz? Also wish to know if there is any freq's that is used (channels). Just wounder as I got a old CB radio with only AM that i tought I would mod to be able to get some use of it. There is a 10kHz space between the channels so wish to know if I should put it to even 10 or 5kHz (e.g. 29.000, 29.010, 29020 OR 29.005, 29015, 29,025).

/Anders

1839. Conflicting amateur population statistics

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-19 00:00:00 UTC
From: billsohl@planet.net
Message-ID: <69vt0h$c2n@jupiter.planet.net>
Source record: 181221
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

In another thread, Michail Dignon (MD) questioned
the statistics I have been providing which come from the
W5YI report. He compares them to those provided by
Joe Spumoni at the spumoni.com web site. I asked
W5YI about the differences. Here's some information
that should be of help deciding which set of numbers is
the more accurate.

From W5YI:
The W5YI numbers come from FCC Report No. 18,
one of the many Amateur Service Reports generated
(automatically) monthly by the FCC in Gettysburg to track
applications and activity. I get (and have saved) this report
for years! (The ARRL also gets it and if my figures were
wrong, ARRL would have told me so - and they
have not. The ARRL gets the same information I do.)

Additionally, W5YI knows Joe Sumoni and has emailed him
about the significant differences in the numbers. If I hear
anything back, I'll pass it on. For now, I'll still put my faith
in the W5YI numbers which have been generated for
many years and are in concert with ARRL numbers
whereas the Spumoni numbers only began being generated
less than a year ago.

hazzard to others.

Eric:

I fully support the new rules, and I'm glad you're out of the business
of using your cheap, dirty, non-type-accepted ham HT on a
commercial aircraft! IMO, one of the most stupid things hams wish
to do is to talk to people on an HT from a commercial airliner, full
of people, on crowded airways, when their equipment is is of such
questionable spectral quality, compared to the VHF/UHF gear used
in the aircraft itself. If I had been in that aircraft with you, I would
have objected to the operation, whether you had permission or not,
and would have demanded to be let off the aircraft if you did not
stop...and taken all the other passengers with me. The fact that

you did this is just further proof of your stupidity! You'd deliberately endanger the lives of hundreds of people just to get the satisfaction of making a few /AM contacts. Right. You are a discredit to ham radio, Oyen. And dangerous.

YOU MIGHT BE AN ENGINEER IF...

A team of you and your co-workers have set out to modify the antenna on the radio in your work area for better reception
All your sentences begin with "what if"
At Christmas, it goes without saying that you will be the one to find the burnt-out bulb in the string
Buying flowers for your girlfriend or spending the money to upgrade your RAM is a moral dilemma
Dilbert is your hero
Everyone else on the Alaskan cruise is on deck peering at the scenery, and you are still on a personal tour of the engine room
In college you thought Spring Break was a metal fatigue failure
On vacation, you are reading a computer manual and turning the pages faster than someone else who is reading a John Grisham novel
People groan at the party when you pick out the music
The blinking 12:00 on someone's VCR draws you in like a tractor beam to fix it
The only jokes you receive are through e-mail
The salespeople at Circuit City can't answer any of your questions
The thought that a CD could refer to finance or music never enters your mind
When you go into a computer store, you eavesdrop on a salesperson talking with customers and you butt in to correct him and spend next twenty minutes answering the customers' questions, while the salesperson stands by silently, nodding his head
You are able to argue persuasively that Ross Perot's phrase "electronic town hall" makes more sense than the term "information superhighway," but you don't because, after all, the man still uses hand-drawn pie charts
You are always late to meetings
You are at an air show and know how fast the skydivers are falling
You are aware that computers are actually only good for playing games, but are afraid to say so out loud
You are convinced you can build a phazer from your garage door opener and your camera's flash attachment
You are currently gathering the components to build your own nuclear reactor
You are next in line on death row in a French prison and you find that the guillotine is not working properly so you offer to fix it
You are still drinking Mr Pibb
You are wine tasting and find yourself paying more attention to the cork screws than the '84 Chardonnay
You bought your wife a new CD ROM for her birthday

You bought your wife's valentine gift at orchard supply
You can name at least six Star Trek episodes
You can quote scenes from any Monty Python movie
You can type 70 words a minute but can't read your own handwriting
You can understand anything Al Gore says
You can't fit any more colored pens in your shirt pocket
You can't remember where you parked your car for the 3rd time this week
You can't write unless the paper has both horizontal and vertical lines
You carry a list for everything except the groceries
You carry on a one-hour debate over the expected results of a test that actually takes five minutes to run
You comment to your wife that her straight hair is nice and parallel
You disdain people who use low baud rates
You do Darth Vader or Battlestar Gallactica impersonations by talking into a spinning fan
You drive a gremlin with a "Beam me up Scotty" bumper sticker
You ever burned down the gymnasium with your science fair project
You ever forgot to get a haircut ... for 6 months
You find yourself at the airport on your vacation studying the baggage handling equipment
You go on the rides at Disneyland and sit backwards in the chairs to see how they do the special effects
You have "Dilbert" comics displayed anywhere in your work area
You have a functioning home copier machine, but every toaster you own turns bread into charcoal
You have a habit of destroying things in order to see how they work
You have ever debated who was a better captain: Kirk or Piccard
You have ever owned a calculator with no equals key and know what RPN stands for
You have ever purchased an electronic appliance "as-is"
You have ever saved the power cord from a broken appliance
You have ever taken the back off your TV just to see what's inside
You have introduced your kids by the wrong name
You have memorized the Discovery Channel program schedule but have seen most of the shows already
You have modified your can opener to be microprocessor driven
You have more friends on the Internet than in real life
You have never backed up your hard drive
You have never bought any new underwear or socks for yourself since you got married
You have used coat hangers and duct tape for something other than hanging coats and taping ducts
You introduce your wife/husband as "mylady@home.wife/husband"
You just don't have the heart to throw away the 100-in-1 electronics kit you got for your ninth birthday
You know how to take the cover off your computer, and what size screwdriver to use
You know the altitude limits for turning on and off electronic

equipment on commercial flights
You know the direction the water swirls when you flush
You know what http:// stands for
You look forward to Christmas only to put together the kids' toys
You need a checklist to turn on the TV
You order pizza over the Internet and pay for it through your home banking software
You own "Official Star Trek" anything
You own one or more white short-sleeve dress shirts
You rearrange the dishwasher to maximize the packing factor
You remember half a dozen passwords and your ten-digit Compuserve address, but you have to call your niece "kiddo"
You rooted for HAL, the computer in 2001: A Space Odyssey
You rotate your screen savers more frequently than your automobile tires
You see a good design and still have to change it
You spend more time on your home computer than in your car
You spent more on your calculator than on your wedding ring
You still own a slide rule and you know how to work it
You talk about the high resolution and picture-in-picture capability of your big screen TV while everybody is watching the Superbowl
You talk about trellis code modulation at parties
You think a pocket protector is a fashion accessory
You think of the gadgets in your office as "friends," but you forget to send your father a birthday card
You think Sales and Marketing are Satan's children
You think that when people around you yawn, it's because they didn't get enough sleep
You think your computer looks better without the cover
You thought the contraption ET used to phone home was stupid
You thought the real heroes of "Apollo 13" were the mission controllers
You use a CAD package to design your son's Pine Wood Derby car
You walk around with your hands in your two front pockets 99% of the time
You want an 24X CD ROM for Christmas
You wear black socks with white tennis shoes (or vice versa)
You window shop at Radio Shack
You would rather get more dots per inch than miles per gallon
You're in the back seat of your car, she's looking wistfully at the moon, and you're trying to locate a geosynchronous satellite
You've already calculated how much you make per second
You've ever tried to repair a $5 radio
Your four basic food groups are: 1. Caffeine, 2. Fat, 3. Sugar, 4. Chocolate
Your checkbook always balances
Your dress clothes come from Sears
Your father sat 2 inches in front of your family's first color TV with a magnifying lens to see how they made the colors, and you grew up thinking that was normal

Your favorite actor is R2D2
Your favorite character on Gilligan's Island was "The Professor"
Your favorite James Bond character is "Q," the guy who makes the gadgets
Your favorite place in San Francisco is the Exploratorium
Your favorite television show is New Yankee Workshop
Your girlfriend says the way you dress is no reflection on her
Your idea of a "good read" is the Edmund Scientific catalog
Your idea of good interpersonal communication means getting the decimal point in the right place
Your ideal evening consists of fast-forwarding through the latest sci-fi movie looking for technical inaccuracies
Your Internet bill is higher than your long distance charges
Your IQ is a higher number than your weight
Your kids refer to you as The Man Who Sleeps with Mommy
Your laptop computer costs more than your car
Your spouse sends you an email instead of calling you to dinner
Your three-year-old son asks why the sky is blue and you try to explain atmospheric absorption theory
Your wardrobe looks like you shop at Goodwill Industries
Your wife hasn't the foggiest idea what you do at work
Your wife thinks your taste in ties is bizarre
Your wrist watch has more computing power than a 300Mhz Pentium
Your wristwatch has more buttons than a telephone

Why don't you check out the CW portion of the band and see if you can find any Lids there? Sure there are bad ops on hf. But most of them are on phone not CW. If we get bozos like the Liberty Net clowns or the ops that try to jam them now, think how bad it would be without the requirement to filter out some of the trash. Does the garbage you hear on 11 meters ring a bell?

Before we do anything to eliminate the CW requirement on hf something MUST be done to enforce illegal operations on the ham bands. Otherwise the only thing you will hear on any band will be the "liberty nets". Lets clean up the garbage on the bands and then address the CW issues.

He operates HF/ae the conversation at hand concerns VHF+. The FCC allows
carriers to regulate the use of "RF" generators aboard their aircraft in
accordance to industry guidelines. The reason that almost ALL will not
allow VHF+ to be used is that they themselves use those frequencies for
ATC and the possibility exists that interfernce may be caused.

: Folks, I have been involved in radio since 1959. This is a disgrace!
: While I blame the culture we live in for producing such individuals,
: I fear for our hobby. Both sides are wrong. Using the radio waves
: for political purposes. All this will do is cause congress to do to
: us what it has done to gun owners. Remember the attempts to ban
: scanners?

I beg to differ I'm afraid. I kind of like the talk I hear on 3950 kHz
although there are some points I don't agree with, it is a good forum to
discuss what we don't hear in the corporate news media. I do admit, I'm
more of a populist/conservative with some libertarian leanings though. I
just wish there would be less attempts to jam on the airwaves too. Most
of the time, the jammers do fail, I can copy most of the hams through the
jammers on my DX-440. I think the point is that if anybody doesn't like
what they hear, turn off the radio or tune somewhere else. I used to be
an avid Rush listener, but since it seems he lost touch with the common
people, I turn him off or listen to another station when he gets me upset.
I just see it as another forum for like minded individuals to voice their
opinions just like talk radio, the internet, or whatever.

Myself, I'm a political junkie and I do admit 3950 kHz does interest me
more than "run of the mill" discussions that you usually hear.

: We must clean up our act.

I'll agree with you on the point of the jammers though. All they do is
waste valuable time and energy.

Well, these are my thoughts on the issue. BTW, I like your callsign,
N9NWO, "N9 New World Order." B-) Just a little humor if you don't mind.
Myself, I like to go by KA3 "World Renowned Womanizer." B-)
Chuck, just some thoughts.....

It depends on the radar. I'd say that in general it shouldn't be a problem,
the waveguide beyond cutoff effect should protect the radar receiver.
But the radar antenna's servo systems might be adversely affected.

I think the best advice here, since the radar is a safety system, is to ask
the manufacturer of the particular radar. If they say don't do it, don't do it.
But I expect they'll say, "no problem".

The same could be said about the FDA, who mandates food inspection, I suppose our food supply would be just hunky dory without them eh? No one would EVER import beef contaminated with mad cow disease would they? The DOT who makes sure that the brakes on your car work, I'm sure Detroit would make sure they worked well out of the kindness of their heart eh? The FTC who makes sure that when you get a home mortgage you don't get a 32% interest loan without having it spelled out in a truth and lending statement. If this is the goverment dictating my behavior then for now, I'll accept it.

>of where they should be, in Ohio. I know there's yet to be any
>uniformity of channel spacing, with neighboring Michigan having
>20 KHz spaces, and I feel sorry for 2m ops near the OH-MI border.

Etc. Basically, the band plans are a gentleman's agreement.

Apparently, people don't want to act in a gentlemanly way.

Of course, most don't take the time to think that ones actions,
when done BACK to you, can tend to be just as annoying and
irritating as yours, done to others.

What's worst is that I, as what I consider to be a considerate
operator, won't stoop to the level of the person who's being
rude and inconsiderate to me.

The person would have successfully "pushed my button" and led
me to choose to do something I personally hated when done to me.

Uh uh, no thanks. All you can do to jerks is kill them with
kindness. They hate that :)

There will be some attrition due to death, not renewing, etc., but
this event should be fairly well distributed over all license classes.

From: pruth@alpha.cc.oberlin.edu
Message-ID: <6a2c96$mvb@news.cc.oberlin.edu>
Source record: 180989

To elaborate on the annoying operating habits of some hams,
I thought it was common knowledge that one should operate
2m FM simplex according to the channel spacing of the state
in which you operate, as well as observing the sub-bands for
simplex (146.40-146.58/147.42-147.585). In Ohio, the channel
spacings for simplex are 15 KHz; in Michigan, it's 20 KHz,
starting from the bottom of each simplex sub-band. Is it
maybe a problem of not doing the arithmetic?
I wonder if there's a way to send out updates and reminders
to every ham to make sure we're all on the same page; seems
like lots of hams have yawning abysses in their knowledge base!
Too bad there isn't a ham course prerequisite for licensure,
to guarantee compliance to law if not courtesy and common sense.

Interesting history, Jeff. But your conclusion, as is so
often the case, is wrong.

You may disagree if you like, but I think that it is
incredibly clear that in our republic, lack of numbers turns
into lack of political clout, and abuse from the political
class, which respects political clout and money, and not
much else.

There are still lots of restrictive ordinances and rules
about. Your interesting post reads as though such
restrictions are a thing of the past. They are not.

Hello. I just got an HTX100. I tried to preform the freqency mod but it did not work. I cut the circuit board trace. Then I hooked up 10K resistor between 5v VCC and those 2 pins I cut the trace for.
This did not work. I checked, and only .5v was getting through the resistor to the pins on the CPU. So I hooked up a jumper in place of the resistor to supply the CPU with 5v. Still did not work. What am I doing wrong? Please email direct. Thank you very much.

Does anyone have any ideas on
1. how to improve cordless phone performance?
legal suggestions are the best, of course :)
Things to do the antenna, or phone systems that work better than
others.
2. where I can buy a "long range" cordless phone. by long range I mean
one mile or so including a few bends and corners. Something I can use
on a 100 acre farm in the mountians and not something limited to a small
yard and is not on a cellular net.

I have tried a digital 900mhz spread spectrum phone and it is better
than a typical cheap 49 mhz version, but it can't take any hills. I
have use something that I found at a local radio shack (not made by
radio shack) and it works well, but that was 10 years ago and they can't
get anymore.

please reply to

>http://www.speroni.com/FCC has a complete breakdown, monthly, of all
>license classes. The number of licensees in ALL classes has shown a
>progressive INCREASE every year.

That statement is a bold faced lie. Look at the data at the website in question. Look at the total numbers of hams by class. Since June 1997 the General and Advanced Class hams (total) have been steadily declining, while the Extra had only a very small increase. Then look at the page that shows licenses left to expire and you see the problem. In Dec 97 no Tech let his license expire (probably because they are not due to be renewed yet) but in all other classes we lost hundreds of hams. Just because we have 'new hams' does not mean that we are doing well. The new hams in each class must exceed the number of number of hams in that class who let their license expire (for whatever reason) so that the new total of hams for that class increases each month.

The average age by class, as of the last time that was available, showed that the average age for General was 63 while the average age for Tech was 43 (rounded to whole numbers in both cases). Ask your insurance company which group is likely to see greater attrition over the next decade.

>commercial carriers.

Nope. For commercial aviation, the operator is the *carrier*, not the pilot.
The FAA has been very clear about this. The PIC of a commercial flight
is *not* authorized to permit you to use a non-exempt electronic device.

Only the *holder of an air carrier operating certificate* can do that, IE
the company. And the company must do that certification by testing
that particular device on that particular aircraft according to EMC
procedures. In other words, it is on a unit by unit and plane by plane
basis, no broad type approvals are allowed. Since that typically means
taking the aircraft out of service for half a day to perform the testing,
no carrier will do that. (Actually it has been done on a couple of special
ocasions involving senior company employees who wanted to use their
amateur equipment on flights of a plane that was undergoing EMC testing
anyway.)

" (c) In the case of an aircraft operated by a holder of an air carrier
operating certificate or an operating certificate, the determination required
by paragraph (b)(5) of this section shall be made by that operator of the
aircraft on which the particular device is to be used. In the case of other
aircraft, the determination may be made by the pilot in command or other
operator of the aircraft."

N5HDQ responded:

> Right on.

Carl/Curtis,

You guys have the wrong Hiram Maxim. You are thinking of Sir Hiram *Stevens* Maxim, who invented (among many things) the Maxim machine gun. He also flew an airplane in England 9 years befoore the Wright brothers flight at Kitty Hawk.. It was a 100-foot wingspan biplane, powered by a lightweight, 160-horsepower steam engine he designed for this purpose. He began flight tests in 1894. On the third try he powered the plane up to 40 mph. It left its track, flew about 200 feet, and crashed. He also invented an amusement park ride called the "Maxim Flying Machine". He was head of the United States Electric Lighting Company in Bridgeport, Connecticut, which I think eventually became todays "General Electric" company.

His son, our familiar Hiram *Percy* Maxim was also an inventor, but not of machine guns. He invented the automobile muffler and the Maxim Silencer for firearms. He was head of Pope Automobile Manufacturing which manufactured the "Columbia" brand of automobiles in Hartford, CT. This company, however, did *not* eventually become todays "General Motors"!

> Does the signal sound different when its a jammer with code versus a jammer
> without code?

Hi Michael, No I don't have a crystal ball to look into to see if the people doing the jamming are coded or not. Not unless they ID that is. But I can also use some common sense logic and come to some reasonable conclusions.

The most obvious is that I really don't think a lot of unlicensed people would go out and by expensive hf radio equipment and set up antenna systems just to jam the bozos on the lib net.

Regardless of if they are licensed for hf or not, we need to clean up the bands and get this type of garbage off of ham radio. It makes us all look bad.

Hi Bruce, I have the ts-570D which is the same radio without 6 meters. I have only had it for about a month now and it has worked GREAT!!!!. I really have not had any problems with it and the DSP features work great to kill most of the QRN at my home QTH.

Indeed, there is no requirement to comply with anything that is not written in stone by the FCC or other regulatory agency. But as sharers of a common resource, voluntary band plans were drawn up to alleviate exactly that ambiguity and discord that existed before they were drawn up.

Before, for example, using FM on 144.200 MHz (which IS legal), it might be a good idea to think of the fact that you'd hate to have someone interfere with YOUR communications, right? Yet you'd knowingly do it to others, right? Not very gentlemanly. Considerate? No. How would you feel were it done to you? Probably pretty angry, right? "Those jerks are on top of us."

On top of that, CAN YOU always hear the station whose operations you are disrupting? CAN YOU? No! If you run 5 watts, and there are people running 1/2 watt simplex, there's quite a good chance that you WILL NOT hear them even though they can hear you.

To all:

What, again, is your excuse for not following voluntary band plans?

They were created by the League, and since you're not a member, it doesn't apply to you?

Isn't being courteous itself enough of a reason? Do you like being treated discourteously and without respect?

ham@w3eax.umd.edu (Scott Rosenfeld [NF3I]) writes:
>To all:
>What, again, is your excuse for not following voluntary band plans?

Sometimes it's not that easy to find out *what* the band plan is.

For example: I'm a ham in British Columbia, Canada. I can look in the ARRL publications, but they list band plans for the USA, not Canada - not very useful. I can check the Radio Amateurs of Canada web site, and they do have a band plan there. Unfortunately, it actually describes the band plan in use in the area of Canada where the RAC headquarters is located, with a note that plans may differ regionally. There is no information about whether my particular region is different, or what the band plan here is if indeed it is different.

The RAC plan specifies a mixture of 15 and 20 kHz spacing (sometimes with interleaving of usage that means adjacent simplex frequencies are 30 kHz apart). In fact, from talking to local hams, it turns out that local conventions are different, using 20 kHz channel spacing everywhere. But it took a while to find that out.

220 is a combination of 2 and 440. It reaches the spots that 440 wont go, but it has much better range than 2 meters.

Have any of you thought about going horizonal and trying sodeband? 2 meter SSB (horizonal) will definatly go much much further than FM/Verticle could ever think of.

>today than before the codeless license existed.

Probably true Michael. It's also probably true that there would be many
fewer hams than there are today if the codeless license had not come into
existence. And, there's a goodly portion of wheat among this so-called
"chaff".

The advent of the Tech license finally persuaded me to do something I
wish I had done years ago - that is to go for an amateur radio license.

You see Michael, as hams we already know what's in it for us. But before
you're a ham, you haven't found out yet whether it's something that will
interest you or not. The investment in time is a gamble - one with
an unknown pay-off.

But somebody probably felt, that in order to keep the hobby healthy, it
should be presented to a greater number of people. Undoubtedly they
realized that the code was discouraging too many folks from finding out
what ham radio was all about, and from discovering the self-satisfying
pay-off amateur radio offers us. According to theory, those who found
it interesting would then continue on with it. Evidently about 250 a
month now find it interesting enough to take the code test and upgrade, in
order to pursue their hobby further. Seems to be working as planned.

There was a web site somewhere?? Maybe at the FCC?? But I
searcdhed and can't find it. Does anyone know the location of
the site that let you plug in your freq, power, ant, etc and get
a figure for conforming to the new RF safety standards???
Thanks!!
Greg

REPLY...

I'm not confusing the two services, Jeffrey. My comment clearly referred to the fact that the CB band is in the HF region, and that a person without any license can use that HF band, but a Technician with a Amateur radio license cannot use any Amateur HF frequency. That seems somewhat ironic to me.

By the way, Jeffrey, you said "among folks such yourself." What kind of "folk" are you prejudicially grouping me with Jeffrey?

But if they already had said equipment to use above 27 mHz...........

> Regardless of if they are licensed for hf or not, we need to clean up the
> bands and get this type of garbage off of ham radio. It makes us all look
> bad.

Earlier in the evening, 7 to7:45 pm I let my receiver sit on 3850 kHz,
waiting to hear some of the terrible gargbage that has so often been
noted her. Not being a fan of such stuff and having never before tried
listening to it there, I didn't recognize any of the players.

Hmmmmm....during the entire 45 minute period all I heard was a bunch
of ordinary sounding individuals, all of whom evidently were acquainted,
discussing rigs, and normal ham radio chitchat. NOT ONE FOUL WORD did I
hear. Not a single jammer showed up and not a discouraging word was
uttered. This, following the superclean 6 hour channel 19 experience of
a couple days ago.

This must be my week to hear only clear air and clean stuff. Sure hope
it turns out to be a trend.

It's a shame you got such a lame answer to your post. This is a
legitimate question, if a rare one.

I do not know how to protect a radio from the emp of a nuclear blast!
But I am sure that there must be some information available on the net,
somewhere. Truth is, as maybee the lame responder did not know, it is a
topic a much discussion for people who build gear for the military. So
if the military can ask, why can't you.

BTW, I doubt that wraping your radio with aluminum foil is the brightest
thing to do, but again, I am not an expert on this subject.

Burying it will definately help, but, it is hard to used burried.

Hoping you find your answer!

I disagree. Its too early to tell.

I suspect that we will find a large number of codeless techs are not
renewing their amateur tickets, once the initial rounds of those licenses
come up for renewal.

Using this logic, Jim, you might as well say that we should just hand out
licenses to people who want them, after they sign an affidavit saying they
have read, understand, and agree to abide by the regulations in Part 97.
I'm sure there are thousands of people who would otherwise get involved in
the hobby if there were no testing requirements whatsoever. I'm also sure
another entire segment of the population would get involved in ham radio
if radios were free for the taking. Let's require Radio Shack to give them
away, shall we?

>Undoubtedly they
>realized that the code was discouraging too many folks from finding out

I seem to have missed the original post so I'll reply here...

I *do* know how to protect a radio from Nulcear EMP, the only problem is no-one except for the military/gov can afford it. I very much doubt that you can do anything with any off-the-shelf electronics other than bury it. I'd not wrap it in Al foil, have someone weld up an iron box, nickel plate it, install suitable gaskets, fill it with dry Argon, seal it, bury it, hope you never have a reason to dig it up.

FYI: I worked on the systems(s) used to EMP test military avionics in situ, project was named 'Trestle'; good luck finding out anything else about it ;-).

It just keeps getting worse! This nut doesn't even know that he could
cause the airliner he is riding in to crash because he fouled up the
glide slope indicator, low approach warning or some other avionics with
a ham radio HT!!!

Wonder why he thinks it's against the law. Some "hazing ritual?"
The "Olde Fartze Pilots Association" keeping the kids in check?

It's plain that in "some places" ham radio licenses come in Cracker
Jacks boxes. I guess we need that here, too.

What's "useless" is not CW - it's m@s@.

Hi Eddie
Someone may show me to be wrong but I don't think you can, plus, is it
really worth it?

Have you, since you signed as an amateur, consider being more creative
method and build your own private, simplex autopatch, autopatch. Then
you can use a couple of watts and an unused band/channel.
Just a thought

well, there's no sales pitch to get people to understand there's a reason to upgrade. amateur radio has always done better at selling to the unlicensed.

now, there's a need for a "here's how to upgrade and why you want to" work and we don't have it.

maybe if general/advanced drop enough, a consolidation might be in order..?

it's probably more due to the TV and CB booms that were followed up by
more and better located TV stations plus cable (removing the need for antennas)
and the bust of the CB market and all those unused antennas up all over town..

i doubt many of the people who write or wrote such CCRs really had amateur
radio singled out when they did so.

when i drive around today, i still see delapidated antennas in various states of
failure. that can't be good for a service that needs 'em...

1918. Icom CI-V radio - interface help required

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-20 00:00:00 UTC
From: Kevin Fisher <klfisher@compusmart.ab.ca>
Message-ID: <01bd254a$2aa361c0$89554bce@default>
Source record: 181108

I am interested if someone can provide information as to how to send data
to the com port in C++.
(This is for a radio controlled using the Icom CI-V standard)

Sample portion of code (Sorry if there are mistakes - I'm just learning
this):

```
--------------------------------------------------------------------------------
------------------------------------------------
# include <iostream.h>

void main ( )
{
char cEnd = 'F';

char szInput[20],
szRemote[20] = 'FE FE 80 E0 7F 02 FD', (Will not change)
szPreamble[20] = 'FE FE 80 E0 05 00', (Will not change)
szEnd[2] = 'FD'; (Will not change)

// Send remote string to com port to force remote control of radio

FE FE 80 E0 7F 02 FD

While cEnd == 'F'
{
cout << "Enter frequency in MHz: ";
cin >> szInput;

// Example of input 162.5500

// Convert input string into proper order for below : 00 55 62
01

// Send preamble out com port along with frequency value and end value

FE FE 80 E0 05 00 00 55 62 01 FD // This is full command needed to
tune radio.

cout << "Enter another frequency [y/n]:";

cin >> cEnd;

}

}
return;
```

(I need to convert this to hex ? and send it out the com port. This is to control a computer controlled radio.)

Any help appreciated.

Thanks

I have been working on marine electronics for 28 years and have never heard of this. We have the same installation and have had several different radars on the boat and never a problem. You may get some RFI from the radar PRF on the SSB but that is all I would expect. Install a good ground on the SSB, tuner and RADAR display to minimize the RFI/EMI.

Why are we comparing bad to worse, or visa versa? May we not set a civilized standard and equally condem all who seek to destroy that?

One of the few purposes of a govenment with power is to defend against those, internally or externally, who seek to violate the freedom of others to function in a civilized environment.

The more we tolerate those who insist upon acting outside of civilized behavior, the more excuses we give to the tyrants (left and right wing) who would in their zeal to protect, actually hurt and destroy.

Let's all turn down the volume a whole bunch ... the only ones impressed are usually those who are making the noise in the first place anyhow.

SAME AS NEW EPSON EX-1000 WIDE CARRIAGE DOT MATRIX PRINTER.

Can't be told from new, extraordinary super shape. Great for doing economical quick printouts of email, drafts, etc. in conjunction with your laser or inkjet. FAR CHEAPER TO RUN THAN an inkjet or laser. Can do all graphics, fonts, found in Windows or on the net in black & white--same as any more expensive black & white laser or inkjet would do.

UNUSUAL NICE FEATURES ARE ILLUMINATED TOUCH PAD BUTTONS FOR:

Select Type Controls

- Draft
- Pica
- Elite
- Normal
- NLQ Roman
- NLQ Sans Serif
- Proportional
- Condensed

LEDS (LIGHTS) FOR:

- Power
- Ready
- Paper

BUTTONS FOR:

- On Line (also has LED too)
- Form Feed
- Line Feed

$50 B/O plus shipping (which isn't much) OR WILL SWAP FOR TUBE TESTER.

Do not have manual, but it's simple to operate.

The unit weighs 36 pounds packed in it's box ready for shipment.

International buyer welcome.

More likly, as Bill Newkirk noted, it was the proliferation of cable
service. The cable company gets a monopoly market for prewiring the
new development with cable and all the developer does is
add a CCR restricting outside antennae.

True, but that is poor operating practice to operate within only
5-10KHz of the input or output of a repeater or a well
known simplex frequency such as 146.52

>
> Mike
>

Because the way the noise figure cascade equations work, the low
noise gain at the front end "swamps out" the noise contribution
of the following stages and dominates the overall system noise
figure ... once you have something like 10-20 dB of low noise
front-end gain, practically anything after that is, to a first
approximation, more-or-less irrelevant.

So, NO, IF gain does NOT "have a HUGE bearing on a receiver's
sensitivity."

Another thing to consider is that, for HF receivers, noise figures
of 10-13 dB are not uncommon, since external noise sources dominate
at those frequencies (note the difference in RX noise output with
and without antenna connected in an HF receiver). However, at VHF
and UHF the receiver's noise figure dominates and sets the limitation
on receiver sensitivity in most cases. Thus, a 1 dB noise figure would
be of little practical use in an HF receiver, but would make a pretty
respectable receiver at 450 MHz).

To summarize ... huge receiver gains don't make for more sensitivity,
so adding huge amounts of IF gain doesn't help a damned bit. Even
adding high-gain preamps won't improve sensitivity unless the noise
figure of the preamp is significantly better than the existing system
noise figure ... all you'll do is overload the front-end and create
a lot of unnecessary intermods and spurious responses.

As you (seemingly reluctantly) observed, low noise figures make for
more sensitivity (at least at the higher frequencies where device
noise is dominant ...

Welcome to the ACS Newsletter, developed by the ACS Training Unit of the State of California Governor's Office of Emergency Services. Please visit our ACS Home Page at http://acs.oes.ca.gov

The purpose of this weekly newsletter is to bring those of us in emergency communications closer together by sharing common ideas, and by introducing new technology into the emergency services community. All individuals with an interest in emergency communications, disaster preparedness or helping the community at large are encouraged to participate here in an open forum.

You will find a virtual community here with representatives from many different organizations with the same common goal: emergency response. We encourage everyone, from whatever organization you represent (or just yourself!) to bring us your ideas, suggestions, concerns, manuals, handbooks, or opinions so that we may share them with the group. To those of you who have just joined us, welcome aboard! Newsletter Subscribers: <524>

.....

>From the Editor's Desk:
Sorry for the lateness of this Newsletter... I'd like to thank the flight crews, staff and agents of United Airlines, who responded promptly and professionally for a quickly needed bereavement flight to Nebraska last week. Also, thanks to the many folks who sent me email this last week. My family and I appreciate your thoughts and prayers.

See you all on Saturday with a complete Newsletter - Dave

.....

Current Events:

From: Stan Harter <Stanly_Harter@oes.ca.gov>

Ed Farmer (HQ ACS staff) reports: "The National Guard has requested I do a class on HF planning. Do you think anyone from OES would want to attend if we did it in Sacramento? What if we did it in Los Alamitos?"

As you may know, Ed is an expert in NVIS and WorldRadio published his definitive compendium on Near Vertical Incidence Skywave propagation. NVIS fits virtually all our intrastate HF communications needs.

Should you like to attend (date and time yet unknown), please make your interest known to me (916) 262-1603 and Ed Farmer (76121.3726@compuserve.com).

From: chiefdoc@juno.com (Robert EB Spencer)

Dave,
Would you be able to put the following information in the "ACS Newsletter" for the next several Saturdays re: Winterfest 98' in Monterey, sponsored by the Naval Postgraduate School Amateur Radio Club:

WINTERFEST 98'
February 21, 1998 (Saturday) 8:00 AM - 1:30 PM
National Guard Armory (behind Monterey Peninsula College)
Monterey, California

FREE Public Service Event

ALL facets of Amateur Radio will be represented and demonstrated!

Spread Spectrum Satellite
Voice & CW Packet
ATV APRS
MARS ARES

Hopefully we will also have several "static" displays:

Red Cross Van (ERV) Santa Cruz ARES Van

The California Department Of Forestry and Fire Prevention Volunteers in Prevention (Amateur Radio Comunications), will also be represented and will have pamphlets on the program, as well as, registration applications.

The Web Page: www.mcktech.com/wf98.htm

On the Web page there are futher details on Winterfesr 98' and many other 'sites', connected to 'ham' radio. There is also a map on how to get to the college and specifically the National Guard Armory!

From: kaf8571@juno.com (Kay E Neil)

Dave,

Can you submit the ICS/SEMS to the acs newsletter for us? It will be at the Saylorville, Iowa Fire Department, 8:30 a.m. to 5:00 p.m. with lunch brought in. There is a small registration fee, but not set yet. The date is February 7.

We are looking forward to the class and I will give you a follow-up on how it went.

Thanks for everything.

We'll be in touch.

Kay Neil

A Communications Center Supervisor Class has been scheduled in Chesterfield, VA for April 15 to 17, 1998. Cost is $279, and hotel accomodations in the area are available for about $65.
Contact APCO Institute for more information
904-322-2500

This week's EMCOMM Bulletin:

EMC115 Comm. Mutual Aid 2/2 For release 1/19/98
Continuation:

Communications mutual aid is a topic that can be confusing to Amateur Radio operators, hence these illustrations.

In the previous bulletin a general outline of the topic was given, followed by specific examples of familiarization (i.e., training) events in Orange County, CA. The following is a continuation of the quotation from a Huntington Beach (HB) RACES newsletter regarding mutual aid for the July 4, l997 holiday parade:

"RACES personnel were responsible for requesting emergency personnel and getting them to the right locations during the injury incidents that occurred. It was clear by the end of the day that we needed some work on the notif-ication process for responding emergency personnel. Next year we will probably station a RACES person with a representative from each of the significant participating organizations: HB Fire, HB Police, HB Public Works, and the California Highway Patrol as well.
Also noted was this in the newletter: "Mutual aid personnel had to receive approval through Orange County RACES". [This illustrates the request-link to the County.]

_____
Other mutual aid request situations were found in the Events Calendar of the Huntington Beach RACES Newsletter, Vol. 5, Issue 2, May 1997 :
1. Mutual aid to Orange County RACES for the Irvine Iranian New Year Festival.
2. Mutual aid for City of Newport Beach RACES for the Walk America in Newport Beach. Both of these events were in April.
3. Mutual aid to Orange County for assistance at the Persian New Year Festival held annually each March.

_____
Also from that same newsletter: The City of Huntington Beach has developed an Employee Emergency Notification Program. It consists of two communications mechanisms: one, the primary, is a phone recording; and the backup is Amateur Radio. In an emergency, employees and family members can phone the Huntington Beach Employee Emergency Information Line. As a backup, family members have a card with instructions for an Amateur Radio operator to get a message through on the

Huntington Beach RACES two-meter frequency. RACES participants in the city can also call the phone number for information about the emergency and whether the EOC is activated. When the EOC is activated the HB RACES is also activated.

_____

While the following is not mutual aid, it's noteworthy. The City of Buena Park RACES reported that the City of Buena Park directed funds to equip its RACES participants with uniforms for identification purposes. Congratulations Buena Park. [From February 1997 Orange County NetControl.]

_____

Non-emergency mutual aid events - such as those noted above - serve as training and familiarization opportunities for eventual emergency situations. Having jurisdiction aid and interest is a vital part of the success of government emergency communications units. (series end)

ACS Web page: http://acs.oes.ca.gov FTP archive: ftp.ucsd.edu/hamradio/packet/tcpip/incoming for new bulletins and ftp.ucsd.edu/hamradio/races for earlier ones. Landline BBS: 916-262-0856 (graphical & standard interface). OES ACS staff manager Stan Harter :Stanly_Harter@oes.ca.gov State Chief ACS Officer Cary Mangum: Cary_Mangum@oes.ca.gov

.....

Please let others in the emergency services field know of the newsletter, and encourage them to join... If you have opinions, suggestions or written material that you'd like to share with the group, let us know. We're always looking for new ideas and suggestions that will benefit everyone.

See you next week!

> antenna ordinances that flout PRB-1

The above is another reason hams should study radio history.

In the middle twenties, a number of communities all over the country passed ordinances restricting, licensing, taxing, or prohibiting operation of amateur radio stations. The ARRL BOD grew concerned about this harassment and asked Paul Segal (League's General Counsel) to pick out a test case to defeat these ordinances once and for all. The first case he picked, involving Portland, Oregon, collapsed after Segal had filed suit in Federal Court, when the town fathers amended their ordinance so that it would not apply to any stations licensed by the federal government. Segal then brought suit against the city of Wilmore, Kentucky, and its chief of police, J.W. Grimes, on behalf of R.B. Whitehurst, 9ALM, seeking to overturn the city's ordinance requiring a license costing $100 per year for the operation of an amateur radio station within the city. After several weeks of intensive on-the-scene effort in Kentucky, Segal had the case blocked out to his own satisfaction. In September, 1927, Judge A.M.J. Cochran of the U.S. District Court for Eastern Kentucky handed down the decision: amateur radio is interstate commerce, even though no compensation is involved and even within a single state because of its effect on other communications between states, and as such must be regulated only by the federal government. The case, known as Whitehurst v. Grimes, is today a cornerstone of amateur defense against local attacks on our right to operate.

(See QST, January 1962, page 40.)

Lack of numbers (what lack?) has nothing to do with restrictive ordinances, Roger. Keep trying, though.

DIVISIONAL NEWS (18/01/98)

TRASH AND TREASURE

Don't forget that the first WIA Trash & Treasure for the year will be on Sunday 1st February at Amateur Radio House Parramatta. The last Trash & Treasure at Dural was well attended, so, sellers - come along and bring your shack's surplus gear to make way for the goodies you will collect at Wyong later in the month. Buyers - be there on the lookout for bargains.

This is a social event as well with old friends meeting for a chat, and a chance to match a face to that callsign you worked recently.

Need anything from the bookshop? This will be open for your convenience, and the office also has preloved gear for sale.

Make a good start to the year -- come to the Trash and Treasure on 1st February. Sellers in at 12 noon, buyers at 1 pm.

-- Pat Leeper VK2JPA Trash & Treasure Officer

EXAMINATIONS

The next examinations will be held on Sunday 15 February 1998 at Amateur Radio House, Parramatta. Entries close on Thursday 5th February -- application forms are available from he office - either call in or ring 9689 2417.

PAYMENT OF SUBSCRIPTION RENEWALS

Will those members who have not yet paid their membership fees due 1st January 1889, please forward the renewal notice and your remittance to Parramatta Office, not to Federal Office at Caulfield Victoria.

VK2 ANNUAL GENERAL MEETING

The Annual General Meeting of the New South Wales Division will be held at Amateur Radio House, Parramatta on SATURDAY 18 APRIL 1998 COMMENCING AT 11.00 HRS.

Nominations for Cuncil and Motions on Notice must be received at the office not later than 12 noon 7th March 1998. Nominations or motions received after the deadline will not be accepted.

Nomination forms for Council will be available at the office from 1st February 1998

'AX' FOR AUSTRALIA DAY

In celebration of Australia Day, all Australian amateurs can substitute the 'AX' prefix for VK during the 48 hours (local time in each State) of the Australia Day weekend of 24-25 January 1998.

Use of the AX prefix is optional. The decision is up to each amateur. This concession for the use of the special event AX prefix was first granted in 1997, following a successful submission to the then regulators in late 1996, the Spectrum management Agency, now part of the Australian Communications Authority.

--Federal Media Liaison Officer Roger Harrison VK2ZRH

[Late addition: We can now use AX on Australia Day itself - sounds likes a typical Federal stuff-up...]

HELP WANTED

We have had a request for a photocopy of an article which appeared in the American or Canadian Amateur Radio Magazine of September 1989 on page 48. The article is called "Transmitter Power Output increased to 100 watts SSB." The modification is for an UNIDEN HR-2510; 10 metre all mode transceiver.

We do not have a copy in our library. If anyone can help with a copy of the magazine, or of the article, we shall be very grateful. Thank you.

submitted by Aub Topp VK2AXT - Division Librarian

WICEN News

The WICEN mailing list can now be accessed via its own domain; those interested in general WICEN discussions are invited to send a message to "majordomo@nsw.wicen.org.au" for further details.

All regions are requested to have their annual reports in to the Management Committee by 31st March, so that the accounts can be closed off for this financial year.

A new event on the WICEN calendar is the mid-year conference of the Volunteer Rescue Association (VRA -- of whom we are a specialist squad), to be held in Wollongong over the weekend of 21st-22nd March. As usual, WICEN will be well represented, and will even find a way of partaking in the upcoming State Wide Exercise.

The Hornsby and District Amateur Radio Club has invited WICEN to its Open Night on 27th January, so this is a good opportunity to show the community just what it is that we do; help from local members is requested. The Central Coast Amateur Radio Club is having its annual Field Day at Wyong Racecourse on 22nd February, and Malcolm VK2YVA is collecting names for the roster; please consider giving up a couple of hours of your time to help out.

WICEN (NSW) will be holding a statewide exercise, prior to the commencement of the John Moyle Field Day, on March 21, 1998. The objectives are to conduct exercises at a local or regional level; to conduct a statewide HF net for field stations; and to encourage WICEN field stations to remain in place and participate in the John Moyle Memorial Field Day Contest. Field exercises at the local and regional level will provide an opportunity for members to operate from their field station and shake the "bugs" out of their equipment and procedures. RCOs may wish to use this activity to make field tests at locations that may be activated during an emergency, such as Emergency Operations Centres, Rural Fire Control Centres and flood plan evacuation centres. Appropriately equipped field stations may wish to participate in an HF net, a function that is not exercised regularly; perhaps at least one HF station per region could participate. Field stations are encouraged to participate in the John Moyle Field day at the completion of this exercise, which will be no later than 1200 hrs local time. It is hoped that regions will be able to conduct this exercise as realistically as possible, including an activation warning message a day or two preceding the exercise, and an actual callout on the Saturday morning, with operators heading into the field as soon as possible to their appointed locations.

If further information about WICEN (NSW) is required, please contact the acting State Coordinator, Alan VK2YYJ, on the WICEN mobile telephone, 015-097-217.

-- Dave Horsfall VK2KFU, President, WICEN (NSW) Inc.

NEW YORK HAMS HELP IN ICE STORM RECOVERY

Hams in upstate New York continue to respond to the weather emergency caused by ice storms that hit the Northeast. But more bad weather could be on the way to the affected areas. Albany County ARES was activated January 8 to assist the American Red Cross. Neighboring Schenectady County ARES ran a flood watch emergency net on the 2m repeater. The Mount Equinox, Vermont, repeater also was being used to relay information to Northern New York counties when HF could not be utilized.

A state of emergency was declared in five upstate New York counties (Clinton, Essex, Franklin, Jefferson, and St Lawrence). National Guard units were dispatched January 9 to assist in recovery efforts. Five Eastern New York hams are assisting at Red Cross Shelters in Malone, in Franklin County. In the early stages of operation Albany-area hams found themselves faced with two problems: first trying to deal with the North Country ice storm, then assisting with localized flooding in several counties.

The ice storms caused massive power and telephone outages in New York's northern counties up to the Canadian border and west as far as Watertown, and east to Burlington, Vermont. In New York alone, as many as 85,000 were reported still without power. Major problems continue

throughout the Northeast, including Vermont, New Hampshire, and Maine, where President Clinton declared all but one of that state's 16 counties as disaster areas. "It is the worst ice storm anyone has ever seen," said Dave Olean, K1WHS, in an Internet posting. Olean, who lives in Maine's southernmost county--York--said he'd lost several antennas due to icing and also lost power for a time. He said the situation was much worse to the north. Widespread power outages also were reported north of the border in Quebec.

As of late this week, amateurs in New York's Capital District were still maintaining links with hams in New York's northern tier. Hams also continue to staff the station at the Red Cross in Albany, and other hams were working locally with disaster assessment teams.

It was reported that "The ham radio operators in the local area have been extremely helpful with providing local information about public service and ham radio resources, " but many ham radio repeaters in the areas of concern are not working because of no power or storm damage.

-- excerpt from ARRL Letter, Vol 17, number 3, dated 16th January, 1998

DX REPORT

SWAZILAND, 3DA. Jon, 3DA0CA, is active on 1827 Khz from 0300 to 0330z most days. QSL via W4DR.

VIETNAM, 3W. JA1IED is QRV as 3W6JQ until January 20. QSL to home call.

MALDIVES, 8Q. Members of the Central Arizona DX Association will be QRV beginning January 18 as 8Q7AA. They expect to be here until January 28. Activity on 160 to 10 meters, using CW, SSB and RTTY, is planned. QSL via N7TX.

KUWAIT, 9K. Bob, N6BFM, expects to be active as 9K2ZZ for about 1 year. He is presently active on 40 meters. QSL via W8CNL.

CHINA, BY. Merv, K9FD, and Price, W0RI, are QRV from BY1QH mainly on the low bands for approximately 10 days. Look for some 160 meter activity around 1823 and 1830 to 1835 Khz. QSL via operator's instructions.

CROZET ISLAND, FT/W. Jean Paul, F5BU, is expected to arrive on Crozet Island, IOTA AF-008, on January 21. He will be active using mostly SSB as FT5WG until March 18. QSL via F6APU.

JORDAN, JY. George, JY9QJ, has been QRV on 160 meters just before 2000z. QSL via DL5MBY.

GUATEMALA, TG. A group of Finnish amateurs hope to activate TG0OH from January 18 to February 5. Activity on 160 to 10 meters, including the

newer bands, using CW, SSB and RTTY, is planned. QSL CW and SSB contacts via OH3JF. QSL RTTY contacts via OH6XY.

BURKINA FASO, XT. Mike, F5RLE, will be active as XT2DM on all bands using mostly CW from January 22 to March 9. QSL to home call.

CAMBODIA, XU. XU2FB is now QRV as XUF2B. QSL via N4JR.

CHATHAM ISLANDS, ZL7. Ed, K8VIR, is QRV as K8VIR/ZL7 until April. He will be active on the usual frequencies. QSL to home call.

--ARRL DX Bulletin 02, dated 16th January, 1998

IPS WEEKLY SOLAR AND GEOPHYSICAL REPORT

(09 JANUARY - 15 JANUARY)

ISSUED ON 16 JANUARY 1998

SUMMARY
Date 09 10 11 12 13 14 15
10cm 82 81 85 96 90 94 98
A 9 7 7 5 5 3 (4 expected)
T 34 14 24 39 27 59 39

Solar was very low until 15th when moderate, with an M1 flare.

Geomagnetic activity observed at Learmonth, WA, was mostly quiet to unsettled 9th and 10th January, and 12th and 13th; mostly quiet on 11th; and quiet on 14th to 15th. There was an active period 1200UT to 1500UT on 9th.

Frequencies were depresssed to 15 per cent early in the UT day 10th, 11th and 13th January; and depressed to 10 per cent early on 12th; otherwise near predicted monthly values.

FORECAST (16 JANUARY - 22 JANUARY)

Solar: Low to moderate.

Geomagnetic: 16 Jan: Unsettled to active; 17-22 Jan: Quiet to unsettled

Frequencies: 16-17 Jan: Near predicted monthly values to 10-20% depressed. 18-22 Jan: Mostly near predicted monthly values.

AUSTRALIAN AMATEUR TELEVISION CLUB INC.

The next meeting of the A.A.T.C. Inc. will be held on February 8th 1998 - and will be the fist one for the year.

Topics for the meeting will include discussion on planning for the Wyong Field Day on 22nd February; and there will be a full demonstration and explanation of the repeater voice ID on our channel 2 of 23cm, given by Dave and Bob.

From the Committee -- have a bright and technical 1998.

For more information about ATV, contact Bob the Publicity Officer on (02) 9587 3491 during normal civilised times -- and ring Bob for the Web site URL.

submitted by the A.A.T.C. Inc. Publicity Officer Bob Barnes

HORNSBY & DISTRICT AMATEUR RADIO CLUB INC.

The Club will again present an Open Night, on Tuesday 27th January 1998, at 7.30 pm, for the public to gain an insight into the hobby of Amateur Radio, also known as Ham Radio.

Many aspects of this fascinating hobby will be on display, with live demonstrations of Amateur Television, Morse Code, HF and VHF voic communications, and Packet Radio, where computers send and receive data via radio waves.

Questions about the hobby are most welcome.

The Australian Ladies Amateur Radio Association, WICEN, the Wahroonga Amateur Historical Radio Association will be represented with displays, and questions are welcomed.

Where! Mount Colah Community Centre, Pierre Close, Mount Colah (near the eastern entrance to the railway station). All are welcome, admission is free, and tea, coffee and biscuits will be available later in the evening.

So come along -- you are welcome.

For further information regarding the Open Night, or the Club in general, write to HADARC., P.O. Box 362., Hornsby 2077., or phone John VK2WRT on 9807 490.

"dictating your behaviour"

Yes, I most certainly will. Here is a case of the federal governments saying to the airlines "Hey, we know you do air travel for a living, you live and die by your safety record, this is your specialty...but we know better than you and we're going to tell you what to do because we're the government. Janet Reno says so."

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

Very Good but, another speculation -- records show ol George left the swords, gatling guns and HT's back at the fort!! Besides 1876 was a low in the sunspot cycle!!!

All in good fun

: ranges...

In mountainous areas, propagation effects can obviously be complex.
It's been my experience also that between 2M and 70cm, the 2M
frequencies tend to work better in the mountains. I've always assumed
that it's because of groundwave, diffraction, and reflection effects.
How's that for a nebulous statement?

I've got numerous examples where 2M is superior. However, I've
also got some examples where 70cm appears to work better, even in the
mountains (in Colorado). I believe that the latter can be mostly
attributed to the antenna aperture effect, as Gary described. The
more circuitous route the wave has to take, the worse 440 is. Conversely,
440 seems to work better (taking everything into account) than 2M when
a mostly line-of-sight path exists. The 440 band also seems quiter (in
terms of natural interference/noise) than 2M.

Although I haven't used 6M, extrapolation from 2M would indicate
that it would work even better in some circumstances, ignoring
"skip" of course.

One interesting observation I've heard about but never verified for
myself is that 1/4 wave vertical antennas can work better in the
mountains than higher gain verticals. Since a 1/4 wave has a higher
angle of radiation, more of the energy goes where you want it to go,
up to the mountain ridges and such to be diffracted. I'd like to
try this for myself...I'm sure the effects vary.

It seems like, lacking repeaters, the HF solution might work the best
with the appropriate pattern (NVI or something). I have very little
knowledge and no experience with this...

Original reports were that the Vanity licenses would have a similar renewal fee at the 10 year point. Subsequent rumors relate that the Vanity license renewals will be treated as a normal renewal which within 10 years will have a fee attached. The question is what the actual fee will be when the FCC enacts renewal fees.

As I told Larry, I consider the extra class license a ripoff. I got 327% more HF phone frequencies by upgrading from general to advanced than you got by upgrading from advanced to extra. The extra 100kHz of CW frequencies would be worthless to me. For me, the benefits of the extra class license are simply not worth the effort. The advanced class license is far and away the best bargain in amateur radio.

Nuclear Blast ?!?!?!?!?!?!?!?
Why would he wanna do that than?
does Darrel know something we dont know - :))

I think we should be told !!

just for the record though, the UK government said that to protect radios
we should wrap them in towels and wrap them in Silver foil !!!
no joke-
i guess only valve sets with point to pint wiring will be useful,
for the poor souls that live.

maybe, some of those'll not work either.
- cant see many transmitters still standing / operating after a
200 megaton airburst either, not that there'll be an electric supply...
maybe they'll use ELF of some other obscure medium -

there was a TV program about just how one 'well-placed' blast would
bring most westernised countries to their knees.

hope there wont be a bomb -
i want to get my PC up to date first !!!

Greetings- I was going to look in the rec.radio.amateur FAQs, but thought I'd ask for anybody's personal experience on this.

I was wondering how long it took from the time I passed my tech exam, to the time my name and new call sign would be posted in the FCC database. I took the test this past Sunday 1/18 in Yonkers, New York. Monday was a holiday, so I suspect the FCC offices were closed.

In addition, are there any recommendations on a dual band HT for a first-timer?

Thanks for any info!
Alan Kaufman

> Gary Coffman KE4ZV | You make it |mail to ke4zv@bellsouth.net
> 534 Shannon Way | We break it |

> Lawrenceville, GA | Guaranteed |

The above is one point of view. Another point of view is that I've never seen a scientifically-controlled test that has EVER conclusively demonstrated, documented, and explained harmful interference to a safety-critical piece of avionics equipment or navaid by an FCC-certified consumer device (meaning, other than devices whose main purpose is to transmit RF energy) operated in the passenger cabin.

Mostly what I've seen is a lot of paranoia and hype from uninformed people, even including (gasp!) licensed commercial pilots. Do you have any specific references in which this type of problem has been thoroughly investigated by someone who understands that correlation does not imply causality? I want to hear frequencies, field strengths, modes of modulation, antenna proximities, receiver intercept points... not "well, golly, I turned on my laptop and the artificial horizon did a flip-flop!"

Still another point of view is that if such an instance of interference to a safety-critical system has, in fact, occurred, then there is an issue of criminal negligence on the part of the FAA for permitting such poorly-designed avionics equipment and archaic modulation modes to be used on board passenger aircraft in the first place.

Another way of expressing the latter point of view: if some kid with a Game Boy in aisle 25 can bring down the plane by booting up Mario at the wrong moment, I think I'll take Amtrak, thank you very much.

Beyond that, are you somehow privy to aspects of the KAL007 incident of which the rest of the world is unaware? I'd be interested in hearing more about the "source of tragedy" you mention.

Really, Gary, this kind of groundless, anecdotal paranoia is beneath the usual high quality standard of your posts.

I have heard that omnidirectional antennas work better than directionals
like yagis, but I haven't thought about the angle of radiation...
Given a centerfed dipole and an endfed 1/4 or 5/8 wave antenna, which
one
has a lower angle of radiation and what effects this angle, especially
when you start stacking the antennas? ie which would be better, a ringo
ranger or stacked dipoles?

I have an antenna design that I have built but not been able to test,
that I invite comment upon. It is comprised of 6 halfwave folded
dipoles. (300 ohm for the folded dipole and 300/6 = 50 feed impedance)
4 dipoles are stacked verticaly, but the top and the bottom sections
have an extra horizontal element phased with a 1/4 wave phasing line
(like a turnstile antenna) The idea was to create a high gain antenna
that also had some gain with horizontal polarization to reduce flutter
and improve performance in areas where there is lots of bounce and
polarization changes. I am missing some theory to complete my idea, but
my initial try gave me an SWR of between 1.5 and 2.5 across the 2m band
but it was wavy (ie the graph went up and down several times across the
band).
What would I need to do to maximize my antenna aperature? (move the
elements farther apart?) How important is an impedance match with the
power dividers and phasing lines?

I haven't spent the time to learn an antenna modelling progam to try and
model this one, I am only going on general principles gleaned from the
antenna handbook, etc.

To carry your conclusions one step further, It would seem that those
that are "showing off" etc, are not using amateur radio as a hobby, but
more as a means to an end, or a vehicle to obtain another hidden agenda.
Or a cheap stress reduction method! "I'll kick him instead of the dog!"

73's,
Bruce

Cecil:
I ran across an interesting piece of Morse code history you may be
interested in while doing a little reading on the subject.

1976 1-year wating period before taking Amateur Extra class test eliminated.
Amateurs are no longer required to certify that they had operated Morse for
a certain number of hours at or above his liscense class speed in the 12
months prior to renewal. Consensus in ranks is that most were lying about it
when they renewed.

Could it be Cecil that the decline in CW use was being discussed and lied
about long before the NO code liscense group even existed. Naw! that would
mean we couldn't blame the poor No codes for starting this argument if that
was true.

Second piece of interesting Morse History
1936 The ARRL requested 13 WPM instead of 10WPM. The book 200 meters and
down states"this was to effectively create a maximum of 16,000 hams,so as to
minimize band congestion." This was granted and the 13 WPM test remained the
lowest test speed until the novice and Techician liscenses were created in
1951.

can anyone say development and implementation of a code Filter by the ARRL
as a matter of policy.

Just thought you would be interested since I"ve heard you and Larry discuss
retesting Amateurs with HF privileges. If nothing else it is interesting why
they dropped the certification at renewal.

The FCC was really naive about human nature back in the 50s. Hams had to swear that they had operated something like one hour in the past month or three hours in the past six months and could still operate CW at their licensed level. (Don't take me literally cuz I don't remember the exact times). But a ham couldn't renew unless he/she signed his/her name to those guaranteed conditions. Many, many hams who didn't even own rigs and had forgotten Morse code simply signed and renewed.

That's fine David, and many people enjoy not using Morse Code at all. The point is that Morse Code is trivially simple for some folks who can learn to send and receive 60 WPM within a week of seeing the code for the first time. These people want and need a challenge that the Extra Class license with its 20 WPM Morse Code exam does not afford them.

My code, called Dave Code (you will be happy to know) will allow those who can pass the Extra Class Theory exam to get what I call the Extra Special License. Is it fair to limit anyone just because most people don't choose to excel?

Yep... after they get below 2.0 (minimum) volts per cell after a full
charge, that means the cell is shorted or sulfated. Time to recycle
them...

Used to be that to re-new a license you had to sign that you
had had 12 contacts in the last 12 months. Also required back
in those days was to log your contacts, and retain that log
for a specified amount of time.

There may have been some, who is to say, that lied about it,
but the fact that one could be spot checked seems it would
have precluded large numbers of Hams from lying.

I remember the requirements vividly because my first call
(WA5KCS) was up for renewal in 1979 and I was assuming that
requirement was still in effect. I had been inactave for awhile
so I broke out the old Knight Kight T-150, R-100A and Heathkit
SB-10 .. strung up an emergency type antenna and logged 12 contacts.
Then before renewal time I went to work out of town mainly for
a couple of years and forgot to renew it anyway.

> for amateur radio call sign tags is $1, and you can have the SAME call sign
> plate on as many vehicles as you own! Makes for some confusion when running
> vehicle registration information (I work in public safety communications).

Well, the way section 5005 of the California Vehicle Code is written:

The applicant shall, by satisfactory proof, show that he or she is
the holder of an unexpired license.

(b) The department shall not issue more than one set of special
plates for any licensed amateur radio station.

(c) In addition to the regular fees for an original registration
or renewal of registration, the following special fees shall be paid:

(1) Twenty dollars ($20) for the initial issuance of the special
plate.

(2) Twelve dollars ($12) for the transfer of the special plate to
another motor vehicle.

Subsection (b) evidently means that I get only one set of call letter
plates per lifetime - my plates were issued in 1963...and they're on a
1991 car which makes Law Enforcement Officers nervous. I don't get plate
updates when they are issued. I'm sure the idiots in Sacramento that
codified (b) meant that you couldn't have the same call letter license
on more than one vehicle.

I've transferred these plates at least a half-dozen times. I guess I
don't get a new set of plates until the old ones are lost, stolen, or
mutilated past recognition.

This is just a note to let all fellow Hams that I had a good experience with Maha. I I ordered a MH-A104 Power linear amplifier from my local Ham Dealer.When it came in it was not as I had expected. In there flyer they stated that you would not have to turn off the amp to run 70cm. Well it turns out that the information was not correct as stated. When I contacted Maha they were more then apologetic about this blunder. They did refund me the difference that it would take to have this unit work as advertised. I would recommend this company to anyone. The amp does work great other than have to turn it off when in 440. All I did was put a kill switch in line and problem solved

I managed to run supermorse ok under windows 3.1... It involves using a PIF file that runs the program exclusively. Windows 95 runs it great with no fancy environment tweaking at all.

I used Supermorse to get from zip to 20+ WPM in just a few weeks. I can't recommend it enough. It really has a lot of nice features and I still can't say I have outgrew it after all these years. I like it so much I put it up on my website, http://members.aol.com/RCrusoe/ab5vh.index.html.

If I have a problem with the program at all it is that the doc is very sketchy on interfacing to a transciever. I use a very simple transmit interface with one component... a 2N2222A. A receive interface is a bit more involved.

The main purpose of this program, to teach and upgrade morse code skills, it admirably met. After the user is satisfied with his ability, he can take a random sample ARRL VEC style sample code test. Ve teams can use the program to give a code test, either directly from the PC speaker or by taping it.

If you intend to run Supermorse under windows 3.1, read the doc files thoroughly. DOS is easier, and W95 is pretty effortless too.

If you are one of those guys who likes to just install and run without reading anything, be advised that you will probably have to do a speed calibration before you do ANYTHING else with the prgogram, so do read the docs first.

That is one reason to be very wary of the GMDSS. It has not really
worked well under fire, from everything I have been able to find out.
It will be touch and go after Feb 01, 1999, until it makes or breaks.
I am hoping it will not take another Titanic affair to settle the issue.

>>>>>>

GMDSS has already been implemented on a voluntary basis by most companies. My ship no longer carries an R/O.

False alarms are not the only weakness of the system. Relying on any shoreside communications system for rescue coordination on the high seas is pretty dumb. A ship in distress seldom is more than a couple of hours steaming from another vessel, and direct fone comms via 2182 are much more efficient than relaying via INMARSAT through a shoreside RCC.

Not carrying an R/O also results in poor maintainance of critical equipment. Ships that have a maintainance contract with a shoreside company are exempt from carrying a licensed GMDSS Maintainer on board. NOBODY is going to do as good a job with at-sea maintainance and repair as a licensed R/O or Maintainer. We're gonna see poor battery maintainance and other problems, and here's a scary scenario... a lightning strike can easily knock out every comm system and every backup onboard. Without a professional RF technician onboard, where does that leave you?

Often watch receivers are turned off. Computers used for INMARSAT and SITOR are used for playing Wolfenstein 3D and Whac-a-mole. Deck Officers simply aren't motivated in that direction, and taking care of not only emergency but also routine comms on watch is an unreasonable burden to have to shoulder anyway. Chief Mates have to do the overtime tallies on watch. 2nd Mates have to do all their chart and pub corrections on watch. Many ships only have a single AB on watch, and he will often be absent from the bridge for short periods, or be distracted from keeping a proper lookout doing general cleaning etc on the bridge. We are looking at a lot of safety compromises already without putting communications duties on the mates.

By the way, we have already seen at least one marine disaster that would have resulted in far greater loss of life had there not been properly maintained autoalarms on 500 Kc and ccompetent, atentive operators manning their shacks. It was written up 2 years ago in the Weather Log. The RCC wanted to handle all comms, but the master of the stricken vessel used SSB for direct comms with nearby vessels anyway, and that decision along with the R/O's training and experience saved lives that day in the North Atlantic.

It will take a massive maritime disaster to turn this thing around. keeping an R/O on board costs a lot of money in salary and other employee related expenses. The companies get out of this by investing 20K in equipment and paying 4 or 5 K a year for a maintainance contract. Safety is not the issue... money is. There are only 2 U.S. flag cruise ships afloat, and they will always carry 2 R/Os each. We will never see a marine disaster on the Constitution or the Independence excaberated by inadequate communications resources. Nobody cares much about the few commercial cargo vessels under U.S. flag on the high seas, and a disaster resulting in the potential loss of all hands is a calculated risk that has been accepted by the insurance and ship operating companies. The tens of thousands of Flag of Convenience ships aren't going to make an impression on our lawmakers when they go down. GMDSS is here to stay.

MD:
I don;t think you will see any losses that are significantly lower or higher than any other liscense class in the ARS today. Some losses are inevitable but I wouldn't count on the No Code liscense groups loosing huge numbers due to the fact that VHF is used for mostly local communication by many of these operators, and is extremely popular as an alternative to cell phones and other communication devices,even though many have both in their homes and Cars.

I believe that a great many shipboard RO's who are also hams, will be
carrying their personal ham radio equipment-including CW capability-
along just in case.
>>>>>>>>>>>>>>>>>>>

Nope, they wont, cause there won't be any more R/O's except on the two passenger ships under our flag, many of the Military Sealift Command ships, and the few commercial ships whose contract stipulates that R/Os will still be carried. I am Bosun of M/V Tellus. I am also a ham, and also hold both GMDSS tickets, Gen Pnone, 2nd class R/T, Ship Radar Endorsement, and USCG R/O. Yes, I will always have my TS-50S on board which is actually a better rig than our ship's HF gear, (One of our R/Os used his for CW because it was quicker and easier to use split than our old stone-age stuff) but most ships will be relying only on the Master or the Mates for all comms, emergency and routine. The few R/Os still onboard will still have the main and reserve receivers and transmitters for MF and HF comms as well as all the new GMDSS required equipment after 1999. Sadly, many use the ship's gear for hamming, so there will still often be no ham rig onboard for backup in the event of a lightning strike or a massive EMP episode. There really aren't many seamen who are hams and who carry their station with them when they fly out to meet a ship.

GMDSS will soon be the only game in town. Disaster aggravated by inadequate comms is a calculated risk that has been long considered by penny-pinching companies. When it happens, it happens, and tough luck. Companies are saving probably $150,000 a year on average per ship by not carrying an R/O and the risk of losing a loss-of-life lawsuit is just a cost of doing business.

How
exactly does one go about getting a HF amateur that may be 20 miles or
2000 miles away to stop being disruptive. Most of the junk I hear on HF
exists because a callsign is being used as a faceless "Handle" to allow a
person to say whatever they wish.
>>>>

I don't want to muddy the issue, but have you spent much time on CW? I really don't hear very much rudeness on CW. (There's still a lot of considerate fone and digital ops out there too, far in excess of the horse's behinds.) Do try CW, though, if you want a more riff-raff free environment. The only problem is it is getting a bit harder to find a good ragchew. Still, when you find a good one, you find a really good one.

Generally, those motivated enough to run for an elected office are motivated enough to upgrade. It is a lot less work to upgrade than to run for, and perform the duties of, an elected officel.

I am an Extra class, and I upgraded at one session from my original license, Tech plus, KC5DKA. I am a Life Member of the league. Yes, I will be more likely to vote for another Extra Class, because technical competence is a big part of the hobby and I expect my elected officials to know at least as much as I do about RF Design, Operating, Part 97, etc, and to have personal knowledge and experience with operating all modes, resolving RFI problems, dealing with local government officials, etc. The average No-Code Tech, while no less a ham than the saltiest old 1X2'er, really hasn't got this kind of experience.

That is not to say that Novices and Techs (of both varieties) should be ignored. Their needs and wants should be considered also. We are all hams, and all League members, and all deserve the same representation. There is room in the hobby and in the league for hams of all knowledand skill levels. I don't even know where my mic is, but I would still like to see at least a slice of a HF fone band for no-coders. But as for a no-code representing me, let him run. If he wins, I will congragulate him and help him out in any way I can. I might even vote for him, but I'll have to see that he has the experience and savvy to deal with the OTHER bloated beaurocracy... our government, and advise both subordinates and superiors on the many issues the league must address.

To mandate that Novices and Techs be represented by others in their license class while other classes are represented by their peers is unfair to THEM...(the Novs and Techs)... why should they be represented by hams who either won't or can't (I HATE that word... I think ANYBODY can upgrade) upgrade? If it happens. fine. But to mandate it would be a shame, and, I think, divisive.

I agree that there is confusion. In fact, in the band plans (ARRL Operating Manual and others) the national simplex freq is listed as 146.52 not 146.525. During the last uhf/vhf contest I tried to find out all the simplex frequency and spacing for this area (Oregon/Washington) so I could set up the scan on the radio. I never found a consensus among the hams in the area. Basically I had to guess for contest purposes.

>i want to buy one TS-50
>do you recomend this !!!???
>

That has been my main rig ever since it came out. It's a nice little radidio for the ham on the go. My whole station fits in my briefcase. I fly out to the east coast and back home 6 times a year so a compact rig is essential. For somebody with a fixed station and a healthy budget, a TS-50S might prove unsatisfactory. There is no Keyer, no VOX, no direct FSK, and my personal gripe, the key jack is in back. There is only room for two filters in that itty bitty box. Forget about adding anything inside other than a CW filter. Computer control is not fully supported as in the bigger KWDs. For the money, though, it's a nice rig, at waaaay under a grand. It was meant to be a mobile rig, and so initially supplies were tight since Kenwood didn't anticipate the popularity if the rig as a base set. It IS a very nice mobile rig. Audio is pretty good for such a teensy little speaker, and an external box makes it shine for SWL.

Another shortcoming I should mention which is standard in compact rigs is there is no direct keypad QSY. You can buy or build the computer interface and buy a keypad from Kenwood, though, and mount it on your operating bench.

The supplied mic has up-down buttons whose increment is set by the menu. there are four assignable function keys that are hand for changing the increment, changing mode, filter, etc, and these buttons can be duplicated in a little dongle with just 6 switches and 4 resistors.

I like the 8 pin mic jack... very handy for interfacing Hamcomm unit or TNC, since received audio is supplied there. (CW keying is not). You can listen to your audio from the onboard speaker and still have audio for data reception. It does FM on 10 meters too. The power output is in 3 steps, factory set at 10, 50, and 100, but it is easy to reduce one or more so you can have 5-W for QRP, 75W for RTTY, etc.

Should you buy one? If you don't have $1600 to spend but still want a new rig, or if you need small size, and you are willing to live with the design compromises endemic with such a tiny rig, go for it. Take a look at the matching power supply and auto tuner also if you are into putting a really slick package together.

I don't think I've used a repeater here in Las Vegas ten times in the last six months. My friends
and I do great on simplex. We use 6m 52.525, 2m 146.520, 223.500, 446.000 and 1.2gig, all on
simplex anywhere we go in the city. I totaly think this is how it's supposed to be. Some of the
hams I've heard will be right behind their friend's car and they're using a repeater on top of an
8500' mountain to talk to each other. What I've noticed about some of these hams is, they don't
know how to switch over to the output frequency of the repeater they're using when they're close.
If someone needs the machine, they'll break in and you'll here them.
I any case, I have most of my fun on simplex, it works for us.

No irony at all. The two services are completely different. What
you should think of when considering CB is a maximum of 4W output,
channelized operation, type-accepted equipment, and only local
communications permitted (see Part 95). You also fail to realize that
the amateur tech license awards the bearer almost 130 MHz of
spectrum in the V/UHF regions in exchange for very little effort
in regards to material learned. Passing the 5wpm code test *will*
give the licensee HF access - much more valuable spectrum than
11m provides.

I agree that the guy using the celular phone was crazy, or stupid, or
both.
There is very known fact that the mobile/digital phones casue most harm
due
to the non linear mode their PA is operating in. This make a very
wide spectural radio noise which casue some other
electronic equipment to behave wierd...

It is not so bad with the VHF radios but I never use them
on the areoplane. Some times you can ask the personel
and one can get permision to use the build in areo planes radio,
it can operate within our frequencies. It goes far this way
and without 'harming' other electronic.

I happened to tune into Pat Robertsons 700 Club tonight about 3/4 of the way through the program, they were discussing "HERF-Guns" (High Energy Radio Frequency) Guns , some of which are supposedly mobile and some that an individual could carry. "Supposedly" these "RF" guns can generate enough "RF" to disable computers, erase or corrupt HD's etc.s (from 50 to 100 ft) and were "supposedly" used during the Gulf War to Cripple some of Saddam's military computer installations. I suspect this is "Junk Science" for the most part as a lot of prior "information" I've seen on the 700 club might as well appear in alt.conspiracy but I was curious if anyone had any insight into this.

Cheers

Chipster

1991. Restoreation of gel cells

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-21 00:00:00 UTC
From: keith@NOSPAMfc.hp.com
Message-ID: <6a50c7$cdu@fcnews.fc.hp.com>
Source record: 181066

Is there any process that can be applied to gell cells to restore their ability to be charged and deliver that charge? I have some Gates 2V cells that originally showed almost no voltage after stitting on a shelf for a long period and while under a voltage charge they will show something around 3.5V but then after removing the charging voltage the voltage drops to maybe around 0.8V. Are these cells destined for the recycle bin?

Yeah, Cecil, I'm afraid you didn't do the proper penance and spend
enough time in the sackcloth and ashes, so your license is invalid.
Just think what you could have done if your whim had said "extra".
Come to think of it, why didn't you try the extra test too? Fear the
code?

>Piotr LA9HFA

Any cellular phone sold in the US has to meet the same spectral
purity requirements as VHF or UHF conventional transceivers.
They are *not* dirtier than a HT. The reason the FCC bans their
use in an aircraft is that they would be heard in too many cells,
causing massive interference to the cellular system on the
ground. The ban has nothing to do with interfering with aircraft
systems.

Cellular systems practice spectral reuse, IE the same frequency
is used over and over by physically separated cells. This works
well when the cellphone is on the ground because only the cell that
it is in, and the immediately adjacent cells, can hear it. Frequencies
are assigned to cells in a pattern which takes this into consideration.

But if you take a cellphone up in an aircraft, it becomes line of sight to
hundreds of cells. Many of those cells will be using the frequency of
the phone to talk to other phones. So all but one of the cells will suffer
interference (only one cell can be talking to a given phone at a time).
That's why the FCC bans cellphone use in aircraft.

As far as causing interference to aircraft radios and other avionics,
the ordinary North American analog cellphone isn't a big concern
because its operating power is low and the frequencies it uses are
far removed from aircraft frequencies. (PCS systems, however,
operate near precision approach frequencies and could constitute
a real hazard.) Some digital systems are also of concern because
their amplitude variations can affect aircraft AM radios far removed

in frequency from them.

A VHF HT is much more of a concern because it operates near
frequencies used by aircraft for communications and navigation,
and it generally operates with 10 db more power than the handheld
cellphone. That's why the FAA restricts their use sharply. But the
FCC doesn't care, it doesn't ban aeronautical mobile use of
conventional transceivers because the HT is less likely to wreak
havoc with communications over a wide area than the cellphone is.
Though if you come up on a popular repeater frequency, you can
key up dozens of repeaters at the same time, and that *is* a nuisance
to the users of those repeaters. But it isn't in the same league as
hitting several hundred cells at the same time.

Even worse than a HT, however, can be some other electric/electronic
devices. For example, an electric razor can wreak havoc with aircraft
communications and navigation systems. Laptop computers are another
source of interference to radio equipment operating at aircraft frequencies.
And a FM broadcast receiver, even if it meets Part 15, often has enough
LO radiation to affect aircraft navigation systems. So these are restricted
or banned during portions of the flight profile by the FAA.

The consequences of interfering with aircraft avionics can be severe,
up to and including loss of the aircraft if the interference occurs at the
wrong moment. There are two basic concerns. One is interference
with air to ground and air to air communications. This could result in
the pilot failing to receive critical instructions from air traffic control
or from other aircraft. A mid-air collision could result. The other is
interference with radio navigation equipment. Enroute this could
result in the aircraft going off course. This might only be a nuisance,
or as with KAL007, a source of tragedy, if not discovered in time.
During precision approaches, interference can quickly be fatal
because there is little time to recover from misinformation generated
by interference. That's why all personal electronic devices are banned
during the critical takeoff and landing phases of the flight.

In some newer aircraft, there is a third concern. Newer aircraft are
adopting fly by wire control systems. If these are confused by interference,
control authority is totally lost, IE the aircraft can wing over and dive into
the ground without the pilot being able to do anything about it. Operating
unauthorized electronics of any sort on an aircraft is not just stupid, it is
criminally stupid.

Ok, but the trouble is staying reasonably mobile through the process.
Has anyone ever tried a magnetic loop antenna that would effectively put
out horizontal polarization but still be "practical" on an auto?
or even some combination of electric and magnetic antennas to improve
reception/transmission and/or operate on a different polarization?

I think Michael has a valid point. We really don't have any idea how many of the no-codes will remain active and renew. It is the new entry level for ham radio and there will always those who loose interest after trying it out and let their ticket drop. It might be interesting to compare the percentage of no-codes that do not renew compared to the number of novices that did not upgrade.

2004. 100-Year-Old Hobby Takes On New Life

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-21 00:00:00 UTC
From: K0HB@JUNO.COM
Message-ID: <885402937.1438580738@dejanews.com>
Source record: 181079

For more information contact: Dr. H. Paul Shuch, Executive Director
(201) 641-1770, or email n6tx@setileague.org

For Immediate Release

LITTLE FERRY, NJ.., January 17, 1998-- For the past century, the hobby of Amateur Radio has challenged the technically inclined with its promise of instantaneous global communications. The world's radio amateurs, also known as hams, have contributed to virtually every breakthrough enjoyed by the telecommunications industry, including the development of the Internet. Ironically, the widespread availability of low-cost digital communications (including cellular telephone, email and the web) has in recent years led to a sharp decline in ham radio's ranks. Now the amateur radio community is revitalizing itself by applying its members' talents in search of other life in the cosmos.

"As our society becomes technologically mature, the role of ham radio has to change," observes Dr. H. Paul Shuch, a lifelong radio ham and the Executive Director of the nonprofit SETI (Search for Extra-Terrestrial Intelligence) League. "Searching for life in space requires the kind of radio skills which hams possess, and cannot be conducted simply by logging on-line. It involves the design and construction of antennas, receivers, and signal analysis hardware and software -- which is what ham radio is all about." With over 700 members in 40 countries on six continents, and a plan in place to grow to 5000 stations in its global radio astronomy network, The SETI League is "the ultimate ham club," according to Shuch. This week he embarks on a two-week lecture tour of Australia and New Zealand, as part of his three-year-old effort to inform and involve radio amateurs around the world.

SETI scientists seek to determine through microwave measurements whether humankind is alone in the universe. Since Congress terminated NASA's SETI funding in 1993, The SETI League and other scientific groups have been attempting to privatize the research. Experimenters interested in participating in the search for intelligent alien life, or citizens wishing to help support it, should email to join@setileague.org, check the SETI League Web site at http://www.setileague.org/, send a fax to (201) 641-1771, or contact The SETI League, Inc. membership hotline at 1(800) TAU-SETI. Be sure to provide us with a postal address to which we will mail further information. The SETI League, Inc. is a membership-supported, non-profit [501(c)(3)], educational and scientific corporation dedicated to the electromagnetic Search

for Extra-Terrestrial Intelligence.

On Feb 20 each year we celebrate the beginning of FSK RTTY privileges on the HF bands and toast the memory of the RTTY pioneers who worked so hard back when it was hard work to get on RTTY.

This is not a contest, there are no logs to send in or scores to keep.
There are no rules, just suggestions:
Use a mechanical teleprinter if you can
Use 850 Hz shift if you can, at least part of the time
Use vacuum tube gear if you can
Wallow in nostalgia
Have fun!

Use the usual frequencies where Baudot operators hang out, and the time of the event is very casual; but Feb 20 is the day as it all started on Feb 20, 1953.

2009. File Formats for QST on CDROM

What kind of method is used to store the text of the articles on
the CDROM's containing archives of "QST?"

I am asking this for a specific reason. "QST" readers who are
blind receive a beautifully-done recording of the text of "QST" each
month as part of the Library of Congress' Talking Book program. These
recordings are professionally done and I have no complaint about them at
all except for one that is nobody's fault. There is no way to
mechanically search back issues and the back issues are starting to
swarm. Each "QST" is about the size of a print magazine and is a large
envelope containing thin flexible disks that are designed to play a few
times and then be thrown away. In practice, they last for years if one
is careful and doesn't step or sit on them or leave them in a hot
place.

If the CDROM's contain bit-mapped pictures of the pages, these
can be converted in to popular graphics formats and fed in to an optical
character recognition system which then converts the text to speech.
It wouldn't sound as good as the original records did, but a CDROM with
several years of "QST" would take up much less space than the two or
three overflowing boxes I presently have. This is not to even mention
the fact that there is no mechanical way to index the information except
to get each one out and play the table of contents.

Basically, I need to know what kind of file system is used on
the CDROM and what kind of format is used to store the "QST" pages?

If there was some way to use one of these CDROM's, I would
probably deep 6 all but the last year or so of records. I just don't
have the room for them. In other words, my reason for wanting to use
"QST" on CDROM isn't all that different from anybody else's reason.
Many thanks for any technical information that would help in deciding
what to do next.

I have a dozen Foster lightweight commercial quality communications headsets for sale. Each headset is fully adjustable with one foam padded earpiece/speaker and articulated electret mic. The connector is a standard 4-pin mic plug with index notch. Will include an instruction sheet showing interface circuit diagrams for Kenwood, Yaesu, Icom and Radioshack radios. $5 each (plus $3 shipping) or 2 for $8 (plus $4 shipping) prepaid.

Thanks,
Scott Adams

I'd expect a station to do MUCH better than that, more on the order
of 2.5KC bandwidth, and my observation tells me this is largely true.

>in those days was to log your contacts, and retain that log
>for a specified amount of time.

I don't think there was ever a requirement that one had to
actually have a specific contact. I recall (could be wrong)
the FCC form required your saying you met the minimum
operating requirements. That could have been met by
simply sending out a CQ and logging it in without ever
actually engaging in a complete two way QSO.

In any case, that requirement is history as it deservedly
should be.

>There may have been some, who is to say, that lied about it,
>but the fact that one could be spot checked seems it would
>have precluded large numbers of Hams from lying.

Just curious, but was ANYONE ever asked to actually
produce their log after submitting a renewal request?
I seriously doubt it ever happened even once.

Is it fair to people who don't want to learn the theory or don't excel at the theory to penalize them? Same argument you make against the code. Heck why don't we do away with it all box up our radios and give the spectrum to someone else that will appreciate it? Everyone wants a free lunch now days. There is no free lunch. The requirements are set so live with them.

SONY PS-LX210 DIRECT DRIVE AUTOMATIC SINGLE PLAY TURNTABLE

Sony's "No Frills" basic direct drive turntable in excellent condition. Have photo of unit in .jpg file format to email you if desired.

FEATURES INCLUDE:

- Plays 33 & 45 RPM (45 Single Play Insert)

- Single Play Turntable Activates With Lifting of Arm & Automatically shuts off

- Stop/Reject in mid play button & 33/45 RPM Selector Button

- Cueing arm

- Designed so controls are right up front. The dust cover need not be lifted

- Spring loaded dust cover hinges so cover either stays up or down without manual support

- Plus/Minus Anti-Skate control dial

- Sony VL-42L cartridge

Clear lucite dust cover with all silver metalic base. The platter itself has brushed bright metal edge. A Very Attractive unit.

$45 or b/o plus Parcel Post Shipping costs which are not much.

OR SWAP FOR TUBE TESTER.

I'll pack it FREE.

Out of U.S. buyer welcome.

2016. FS/SWAP for Tube Tester--8 Track/Reel to Reel Dub Deck by Akai/Roberts

Unusual AKAI/ROBERTS 1725-8L III REEL TO REEL & 8 TRACK DUB DECK

A Very Unusual deck for 8 Track lovers. This unit was probably made by Akai is my guess for Roberts. Says Made in Tokyo Japan on it.

From the Back of the Unit it states:

MULTI-PURPOSE TAPE RECORDER

4 Track Stereo/Mono Reel to Reel
8 Track Stereo Cartridge
Transfer from reel to Cartridge

The unit appears physically in fair to good condition for its age. I do not have a power cord to fit the unit or manual, so I cannot vouch for its mechanical condition by testing it. It is best to assume it may need some attention. $50 or best offer

OR SWAP FOR TUBE TESTER.

Plus U.S. Parcel Post Shipping costs which are not much.

I'll pack it free

International buyer welcome.

>Jeff KH2PZ

First, I have to realistically ask, just how many of the 700,000 amateurs even have a working transmitter? Second, Eric expressed an opinion, about amateur radio, just as valid as let's say yours. I've read for example more discussion about the Liberty Net, and various groups of lids than I've seen let's say discussion of how to be sure my frequency display is relatively accurate.

Why do for example those who regularly spam, seem to produce more response on Usenet, than those, who ask how to properly tune an old linear or replace capacitors in said linear? I also note that on 75 meters, where I live, I can find not one, not two, not three, but at least six frequencies where jamming, and other liddish behavior is common. It's also difficult to find a frequency that's free at times too, that doesn't have an imitator of one of the participants of the iLiberty net holding forth, insulting and proclaiming the right to do so.

>
The "battle" you describe is between individuals and groups of individuals because neither party can respect the views of the other. I make my views heard on occasion, and I am very pro-CW. It is my favorite mode, and I wish it was everybody's favorite mode. However, for the sake of harmony and to ensure enjoyment of the bands by the greatest practical number of hams, I am quite satisfied to live in an imperfect world. If a new ham doesn't want to learn the code, and he only wants to buy a brand new HT and key up the local repeater and call himself a ham, that's fine with me. I'll give him all the help I can. I think if I did not like CW, I would be equally tolerant of the CW guys doing all that deebity-beep stuff I wouldn't understand, and I would concentrate on our common interests rather than our differences. You can get me into a logical debate on the merits of CW, but nobody can get me into a shouting match over it. Yet, I am as Pro-CW as they come. The "battle" is between people who will not respect a differing opinion.

As for rudeness on the air, the rudest thing anybody has said or did to me on the air, even when I was a tech too, was a rather blunt remark when I stated that I no longer QSL, and have never saved QSLs. This ham was mainly concerned with hanging paper on the walls, and I was /QRP and /MM and from a state and on a band that he did not have. Even then he wasn't really rude, just a bit vocal about the importance of QSLing, a matter that I personally find trivial. Rudeness? Never been subject to it on the ham bands. Maybe it is because I mostly do CW. Try it sometime, Drew. CW ops don't waste time beeping rude comments. Not worth the effort, I guess.

As for refusing to work Techs, I never sat down at the key and sent CQ for more than 10 or 15 minutes on an open band with a decent signal going out without getting an answer while I was a Tech. I was helped and advised absolutely any time I needed it. Ham Radio has been a very positive part of my life.

Yes, there is quite a bit of rudeness on fone. I think it is because most rudeness is impulsive, and speaking into a microphone allows a lot of impulsive remarks to spill out. We often don't think about our words before we speak them. Like the Arab said, "Before a man speaks a word, he is the master of it. After the word is spoken, it is the master of him". Sitting at a key or a

keyboard, there is sort of a buffer between man and rig, and time to consider each and every word, though i admit I see evidence on these ngs that a few people don't take advantage of this.

I make no bones about my opinions on CW. Yet, I am not harrassed for those opinions. A somewhat less combative stance would go a long way toward keeping others off your back. Hiding behind an anonymous CB handle isn't the answer. Don't you still get flamed anyway?

Sorry... I missed the show on rec.radio.scanner. Never read that ng, as I did not think there would be much there that interested me. Actually, whenever there is a lot of mudslinging in a particular thread, I just don't read it.

The real issue usually pops up somewhere else while the combatants stay right where they are for a few more salvos.

OK, so let's say you do get flamed worse for using your call or name than using your CB RAMBO sig. So what? What's the big deal? Why be so sensitive about it? Just dont read or acknowledge a post or an e-mail that appears to be all abuse and no substance. You don't have to read it. If anybody else reads it and takes it to heart, it doesn't speak well of the reader either, and you really should't be overly concerned with what the reader, in his ignorance, thinks of you.

Of course no callsign is required... I wouldn't like to see that at all, as it would bar ham-curious newbies from the group. Safer? I don't get it. Do you think somebody will get so mad at you even when you are hurling abuse at him that he will come hunt you down and give you a good stomping? I doubt it. Personally, if that happened to me, I would cheerfully shoot my attacker, but I digress. I doubt that you would be assaulted offline by anybody no matter how rude you are to him on-line. The most obnoxious guys you can imagine on the air and on the net are probably pretty courteous when face-to-face with somebody. The safety thing seems therefore to be a non-issue. As far as being perfectly acceptable goes, since you have a call, I think I would label keeping it a secret to be MARGINALLY acceptable, not "perfectly" so.

Give CW another try. download Supermorse or another shreware morse tutor and work with it, get up to a good conversational speed, upgrade to general, and try out your new priveleges on HF CW before dismissing us all as a bunch of bozos, and HF as boring you to tears with drivel.

You can e-mail me if you like for my website where you can still download SUPERMORSE for now. I'm gonna take it down and put something else up there in a couple of days. I don't want to keep plugging my onw site here even though it isn't commercial.

I'm sorry the inconsiderate few have soured you on Amateur Radio, Drew. Hopefully, you will approach it from another tack before letting your ticket expire. Meanwhile, I still am curious as to why you are still lurking and pouncing here if you are not interested in hamming.

If I can be of any help, let me know.

>
>Jeff KH2PZ

Jeff look at the numbers regarding growth and upgrades with an open mind, we can't accept figures like those posted for last year and survive or keep our spectrum. Many people are crying about Amateurs not being innovative or leading in the development of new technology. Read the requirements because of part 97 the FCC placed on TAPR and the groups that want to expierement with Spread Spectrum. At a time when expiermentation in new technologies is being encouraged by our goverment, the Amateur services are still being contolled by regulations that existed when most of us were still using tube technology. Many people, who would be interested in Amateur radio are put off by the code requirements. You may not like that fact and call them lazy or consider them poor canidates for the ARS, but we need a constant infusion of new people and ideas or the ARS will not be competive with the newer technologies. European operators are doing packet at speeds that rival the internet while the fastest networks we have are 1200 or 9600 baud, this is just one example . Their goverments are working with their amateurs to encourge developing technologies. While we labor under rules, regulations and requirements that not only stifle and impede progress but have given rise to two Amateur radio services, with two very different agendas.

How would you propose to scientifically test all possible
oscillator/mixer/etc schemes that might be used in whatever type of
consumer electronis that could be carried aboard a jetliner? How could
you be sure that those that might pass such scrutiny were correctly
operating as designed?
What are the odds that a screwball mixer product might land on the
pilot's comm frequency and cause him to miss a critical instruction? Or
interfere with some other critical electronic application such that he
could not detect it? Would it take a disaster to convince you? In fact
do you KNOW beyond doubt that just such a disaster has not already
occured and not been identified? Have you ever personally observed the
unexpected result of this type of mixing/interference where the result
surprised you, and you proved the cause?

> Mostly what I've seen is a lot of paranoia and hype from uninformed

You seem to be unfamilar with the term "Installed base" and its implications,and the ramifications of mass change, particularily when such a problem can be easily controlled by very limnited restricting of passenger activty--which is naturally restricted anyway!

>
> Another way of expressing the latter point of view: if some kid with a Game Boy in aisle 25 can bring down the plane by booting up Mario at the
> wrong moment, I think I'll take Amtrak, thank you very much.

The example is rather farfetched, wouldn't you say? Perhaps several magnitudes removed from a 3 watt HT transmitting on or near a communications or navigation frequency, and held to a window.

>
> Beyond that, are you somehow privy to aspects of the KAL007 incident of

???? Did we read the same paragraph? I thought he used it as an example of how things can go terribly wrong because of a seemingly innocent mistake.

> Really, Gary, this kind of groundless, anecdotal paranoia is beneath the
> usual high quality standard of your posts.

You can take Amtrak and assume the tracks will hold up OK and that no gasoline tankers will try to 'beat the train' and cross in front of you. As an active ham who would very much like to use an HT at 30,000 feet since I occasionally find myself there anyway, I fully support Gary's position. No paranoia involved, just a working sense of self-preservation and knowledge of how harmonics and mixing products CAN and DO cause real problems.

2026. FS/Trade IC-2710 plus complete PACKET setup

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-22 00:00:00 UTC
From: "Stephen T. Portell" <portell@azstarnet.com>
Message-ID: <34C7BDDC.44C9@azstarnet.com>
Source record: 180851

For Sale or Trade for HF rig (preferably an ICOM 706 or 706MKII + cash)

Icom's powerful IC-2710. Not a scratch on it

Accessories:
--MFJ-812 VHF/UHF SWR/Wattmeter
--MFJ-1270B TNC-2 PACKET
--8 pin TNC controller cable that integrates the IC-2710's HM-98 mike
with the TNC
--RS-232 data switch to integrate the TNC and a typical PC modem
--two mounting brackets for IC-2710

I'm taking the code test to complete my Advance license. I need a
compact, mobile HF rig that can run on 13.8VDC.

Please contact me at...

portell@azstarnet.com

Lucent Technologies has one with 4,000 foot range--nearly one mile. That's the best distance I have heard of. The price is steep, 300 to 400 dollars, depending upon source and specials.

Many other 900 MHz cordless phones will do 1,000 feet. My Corbra Intenna will do this, and it scrambles the signal so it can't be readily heard on a scanner. Price about $350.

At $125 and below, expect about one city block range....about 500 feet.

Consider the new cellular/cordless phone combos. They are a cordless phone out to 1000 feet, and then switch to Cellular. No airtime charges while they are in cordless mode.

For a really big farm, consider some of the new trunked systems. Expensive, but will keep you in touch with the base--anywhere--and can make phone calls.

There is plenty of evidence. From:

http://www-afo.arc.nasa.gov/ASRS/cb_201.html

"After departing VFR, I picked up an IFR flight plan, and was given a clearance. Abeam one
intersection, Approach advised that I was 7 miles south of course and provided a heading to
reintercept. I began course correction and configured the Loran for course guidance. On further
comparison, it was determined that both VOR receivers were suspect as they both indicated 8 degrees off. This prompted a query of the two passengers, children ages 7 and 12, after which it was found that both were using portable tape players. Both units were turned off, and the VOR receivers returned to normal operation. "

Thast's just the first hit I found. The ASRS (the NASA clearinghouse for aviation safety anecdotes) probably has plenty more.

If you think it's all bunk, start your own airline. If you start your own airline, I hope you don't have a problem with authority figures :-)

I've been using a Yaesu FT-101. The procedure for calibrating the tuning dial calls for tuning to the nearest 100kz mark, turning on the internal 100khz oscillator, and using the dial to tune for a Zero Beat. Well I hear the 100khz tone loud and clear, but I'm not clear on when I have zero Beat. Is it when the tone is at it's highest pitch, lowest pitch, or in the middle when my S meter has the largest deflection? Any info on zero beat would be greatly appreciated.

Well, falsifying a government document can carry a penalty, as I
was/am accutely aware of, my being 20 years in the Navy. So for
me it made more sense to make the contacts and be legal than take
a chance, remote as it may have been, and stand the risk.

> Like the Morse code testing requirement of today, it was an

> simply sending out a CQ and logging it in without ever
> actually engaging in a complete two way QSO.

Could have been ... it's a mute point .. you did have to
sign a statement on the re-newal form something about having
operated your station 12 times in the past 12 months .. Technically
speaking I guess sending out a CQ is ...Operating your Station ..
but I never considered I had operated my station unless I had
someone to operate with. I will not swear to the exact wording
of the statement you had to sign .. but it still seems to me that
it was ... I have made 12 contacts within the last 12 months.

> In any case, that requirement is history as it deservedly
> should be.

That is your opinion, that the requirement should have been
dropped. I had no problem with the requirement, and would have
none now should it be re-born. I would have a problem if the

logging requirement was brought back such as it was in the old days that you were supposed to log time on/off of each xmission. That was not to bad in the old AM days style .. check into a round table .. wait your turn .. hammer down for 10 minutes .. log on/off time and wait 30-45 minutes until it was your turn again ... and keeping all those notes on what to comment on .. I would not have a problem now if a requirement was in effect that you had to log what frequency, time began and time ended and maybe what stations you worked .. but each individual xmission you made would be murder now to log.

As a matter of fact, I wrote a logging program that has fields for Call, name, city, date first worked, address, phone, and such and a database where you can log your station operation .. time on/off .. freq .. emission .. power .. and several lines of text where you can record what ever you want to about that session, such as stations worked .. anything unusual that happened .. or whatever.

The program also has a database that you can maintain of Companies, such as Kenwood, RF Parts or whoever .. has fields for Name, Products/Services .. who to contact .. address and phone numbers.

AND ... for when your in a QSO and a technical discussion arises, I wrote a scientific calqulator (a graphical mouse driven on) that has alongside it a list box of formulas .. you can edit/add/delete formulas to your liking with a text editor .. that can be called up from the logging program without closing the logging program, and return to the logging program .. All these features are accessed via the old standard drop down menus ... There are a couple of functions that don't work yet in the calculator so I coded the log program so if the Calculator is not in the same directory you get a message that it is not available .. I do not give out the calculator yet, I don't want a glitched program out there with my name on it.

There nis also a 10 minute timer in the logging program .. It is an exe file .. DOS based, so it runs fine on a clunker .. but works in windows .. including Win-95 .. but looks better in windows if you set program properties to full screen ... The mouse works in DOS too.

Now, having said all that, If enough people show interest in the program I could zip it up and make it available for downloading at my web site ... http://wf.quik.com/n5hdq

One last thing, I learned the hard way that if a database was open in the program and you lost power, the puter frooze up, or whatever the database would become corrupted so I figured out how to code it so you open the database as needed, retrieve/edit a record then close the DB .. It was a bugger figuring out how to keep track of where you are in the DB when searching/editing a record but I got it to work. Now if you have a power failure it would have to be at the

exact split second the DB is open for reading/writing before you
would lose anything.

> >There may have been some, who is to say, that lied about it,

> >have precluded large numbers of Hams from lying.
>
> Just curious, but was ANYONE ever asked to actually
> produce their log after submitting a renewal request?
> I seriously doubt it ever happened even once.

I have no idea if anyone ever got checked .. but I never worried
about it as I never falsified the re-newal form.

SB DX @ WW $OPDX.340.1
OPDX Special Bulletin No. 340.1

The Ohio/Penn Dx PacketCluster
Special DX Bulletin No. 340.1
BID: $OPDX.340.1
January 21, 1998
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 440-237-8208 28.8k-1200 Baud 8/N/1 (New Area Code!)

The following is an excerpt from ARRL Bulletin 8 (ARL008):

"Approved by the Board were rules changes for the DXCC program that had been recommended by the DXCC 2000 Committee. Under the new criteria, no countries currently on the DXCC list will be removed. In the future, countries will be referred to as entities. A political entity will be added to the DXCC list if it meets any one of three criteria: it is a UN member state, it has an ITU prefix block assigned, or it has a separate IARU member society. The new criteria also replace all DXCC measurements, including physical separation distances, with metric system figures roughly equivalent to the former distances. While the 57 entities on the deleted list will remain, no new countries will be added to the deleted list in the future. Deleted entities simply will be removed. In addition, the new rules specify a minimum ''island'' size of 100 meters measured in a straight line. The DXCC field checking program will remain in place. The effective date of the changes will be announced later this year. The DXCC 2000 Committee was discharged with the Board's thanks."

Here are the new DXCC Rules adopted by the Board of Directors during their January meeting last weekend. The implementation date is March 31, 1998.

Revision dated: 17 January, 1998
American Radio Relay League
DX Century Club Rules

INTRODUCTION

The DXCC List is based upon the principle espoused by Clinton B. DeSoto, W1CBD, in his landmark 1935 QST article, "How to Count Countries Worked, A New DX Scoring System." DeSoto's article discussed problems DXers had in determining how to count the DX they had worked. He presented the solution that has worked successfully for succeeding generations of DXers.

In DeSoto's words, "The basic rule is simple and direct: Each discrete geographical or political entity is considered to be a country." This rule has stood the test of time • from the original list published in 1937 to the ARRL DXCC List of today. For more than 60 years, the DXCC List has been the standard for DXers around the world.

DeSoto never intended that all DXCC "countries" would be countries in the traditional, or dictionary, meaning of the word. Rather, they are the distinct geographic and political Entities which DXers seek to contact. Individual achievement is measured by working and confirming the various Entities comprising the DXCC List. This is the essence of the DXCC program.

DXCC activity was interrupted by World War II. In 1947, the program started anew. Contacts were valid from November 15, 1945, the date US amateurs were authorized by the FCC to return to the air.

Over time, the criteria for the List have changed. However, Entities are not removed when changes are made. The List remains unchanged until an Entity no longer satisfies the criteria under which it was added. Thus, today's DXCC List does not fully conform with today's criteria. Changes are announced under DXCC Notes in QST.

SECTION I. BASIC RULES

1. The DX Century Club Award, with certificate and lapel pin (there is a nominal fee of $5 for the DXCC lapel pin) is available to Amateur Radio operators throughout the world (see #15 below for the DXCC Award Fee Schedule). ARRL membership is required for DXCC applicants in the US, its possessions, and Puerto Rico. ARRL membership is not required for foreign applicants. All DXCCs are endorsable (see Rule 5). There are 12 separate DXCC awards available, plus the DXCC Honor Roll:

a) Mixed (general type): Contacts may be made using any mode since November 15, 1945.
b) Phone: Contacts must be made using radiotelephone since November 15, 1945. Confirmations for cross-mode contacts for this award must be dated September 30, 1981, or earlier.

c) CW: Contacts must be made using CW since January 1, 1975. Confirmations for cross-mode contacts for this award must be dated September 30, 1981, or earlier.

d) RTTY: Contacts must be made using radioteletype since November 15, 1945. (Baudot, ASCII, AMTOR and packet count as RTTY.) Confirmations for cross-mode contacts for this award must be dated September 30, 1981, or earlier.

e) 160 Meter: Contacts must be made on 160 meters since November 15, 1945.

f) 80 Meter: Contacts must be made on 80 meters since November 15, 1945.

g) 40 Meter: Contacts must be made on 40 meters since November 15, 1945.

h) 10 Meter: Contacts must be made on 10 meters since November 15, 1945.

i) 6 Meter: Contacts must be made on 6 meters since November 15, 1945.

j) 2 Meter: Contacts must be made on 2 meters since November 15, 1945.

k) Satellite: Contacts must be made using satellites since March 1, 1965. Confirmations must indicate satellite QSO.

l) Five-Band DXCC (5BDXCC): The 5BDXCC certificate is available for working and confirming 100 current DXCC countries (deleted countries don't count for this award) on each of the following five bands: 80, 40, 20, 15, and 10 Meters. Contacts are valid from November 15, 1945.
The 5BDXCC is endorsable for these additional bands: 160, 17, 12, 6, and 2 Meters. 5BDXCC qualifiers are eligible for an individually engraved plaque (at a charge of $30.00 US plus shipping).

m) Honor Roll: Attaining the DXCC Honor Roll represents the pinnacle of DX achievement:

i) Mixed--To qualify, you must have a total confirmed country count that places you among the numerical top ten DXCC countries total on the current DXCC Countries List (example: if there are 329 current DXCC countries, you must have at least 320 countries confirmed).

ii) Phone--same as Mixed.

iii) CW--same as Mixed.

iv) RTTY--same as Mixed.

To establish the number of DXCC country credits needed to qualify for the Honor Roll, the maximum possible number of current countries available for credit is published monthly in QST. First-time Honor Roll members are recognized monthly in QST. Complete Honor Roll standings are published annually in QST, usually in the July issue. See DXCC notes in QST for specific information on qualifying for this Honor Roll standings list. Once recognized on this list or in a subsequent monthly update of new members, you retain your Honor Roll standing until the next standings list is published. In addition, Honor Roll members are recognized in the DXCC Annual List for those who have been listed in the previous Honor Roll listings or have gained Honor Roll status in a subsequent monthly listing. Honor Roll qualifiers receive an Honor Roll endorsement sticker for their DXCC certificate and are eligible for an Honor Roll lapel pin ($5) and an Honor Roll plaque ($30 plus shipping). Write the DXCC Desk for details or check out the Century Club Item Order Form at
http://www.arrl.org/awards/dxcc/

v) #1 Honor Roll: To qualify for a Mixed, Phone, CW or RTTY Number One plaque, you must have worked every country on the current DXCC Countries List. Write the DXCC Desk for details. #1 Honor Roll qualifiers receive a #1 Honor Roll endorsement sticker for their DXCC certificate and are eligible for a #1 Honor Roll lapel pin ($5) and a #1 Honor Roll plaque ($50 plus shipping).

2. Written proof (i.e., QSL cards) of two-way communication (contacts) must be submitted directly to ARRL Headquarters for all DXCC credits claimed.

Photocopies and electronically transmitted confirmations (including, but not limited to fax, telex and telegram) are not currently acceptable for DXCC purposes. Staff may accept electronic confirmations when procedures to do so are adopted.
The use of a current official DXCC application form or an approved facsimile (for example, exactly reproduced by a computer program) is required. Such forms must include provision for listing callsign, date, band, mode, and DXCC country name. Complete application materials are available from ARRL Headquarters. Confirmations for a total of 100 or more different DXCC Credits must be included with your first application.
Cards contained in the original received envelopes or in albums will be returned at applicant's expense without processing.
By action of the ARRL Board of Directors, 10-MHz confirmations may be credited to Mixed, CW and RTTY awards only.

3. The ARRL DXCC List is based on the DXCC List Criteria.

4. Confirmation data for two-way communications must include the call signs of both stations, the Entity name as shown in the DXCC List, mode, and date, time and band. Except as permitted in Rule 1, cross mode contacts are not permitted for DXCC credits. Confirmations not containing all required information may be rejected.

5. Endorsement stickers for affixing to certificates or pins will be awarded as additional DXCC credits are granted. For the Mixed, Phone, CW, RTTY, 80, 40, and 10-Meter DXCC, stickers are provided in exact multiples of 50, i.e. 150, 200, etc. between 100 and 250 DXCC credits, in multiples of 25 between 250 and 300, and in multiples of 5 above 300 DXCC credits. For 160-Meter, 6-Meter, 2-Meter and Satellite DXCC, the stickers are issued in exact multiples of 25 starting at 100 and multiples of 10 above 200, and in multiples of 5 between 250 and 300. Confirmations for DXCC credit may be submitted in any increment, but stickers and listings are providing only after a new level has been attained.

6. All contacts must be made with amateur stations working in the authorized amateur bands or with other stations licensed or authorized to work amateurs. Contacts made through "repeater" devices or any other power relay methods (other than satellites for Satellite DXCC) are invalid for DXCC credit.

7. Any Amateur Radio operation should take place only with the complete approval and understanding of appropriate administration officials. In countries where amateurs are licensed in the normal manner, credit may be claimed only for stations using regular government-assigned call signs or portable call signs where reciprocal agreements exist or the host government has so authorized portable operation. Without documentation supporting the operation of an amateur station, credit will not be allowed for contacts with such stations in any country that has temporarily or permanently closed down Amateur Radio operations by special government edict or policy where amateur licenses were formerly issued in the normal manner. In any case, credit will be given for contacts where adequate evidence of authorization by appropriate authorities exits, notwithstanding

any such previous or subsequent edict or policy.

8. All stations contacted must be "land stations." Contacts with ships and boats, anchored or underway, and airborne aircraft, cannot be counted. For the purpose of this award, remote control operating points must also be land based. Exception: Permanently docked exhibition ships, such as the Queen Mary and other historic ships will be considered land based.

9. All stations must be contacted from the same DXCC Entity. The location of any station shall be defined as the location of the transmitter. For the purposes of this award, remote operating points must be located within the same DXCC Entity as the transmitter.

10. All contacts must be made using callsigns issued to the same station licensee. Operation by an operator other than the licensee must be in accordance with the regulations governing the license grant. You may combine confirmations from several call signs held for credit to one DXCC award, as long as the provisions of Rule 9 are met. Contacts made from club stations using a club callsign may not be used for credit to an individual's DXCC.

11. All confirmations must be submitted exactly as received by the applicant. The submission of altered, forged, or otherwise invalid confirmations for DXCC credit may result in disqualification of the applicant. Any holder of a DXCC award who knowingly submits altered, forged or otherwise invalid confirmations will forfeit the right to continued DXCC membership. The ARRL Awards Committee shall rule in these matters. The Awards Committee shall also determine the future eligibility of any DXCC applicant who has ever been barred from DXCC.

12. Conduct:
Exemplary conduct is expected of all amateur radio operators participating in the DXCC program. Evidence of intentionally disruptive operating practices or inappropriate ethical conduct in any aspect of DXCC participation may lead to disqualification from all participation in the program by action of the ARRL Awards Committee.
Actions that may lead to disqualification include, but are not limited to:

a) The submission of forged or altered confirmations.

b) The presentation of forged or altered documents in support of an operation.

c) Participation in activities that create an unfavorable impression of amateur radio with government authorities. Such activities include malicious attempts to cause disruption or disaccreditation of an operation.

d) Blatant inequities in confirmation (QSL) procedures. Continued refusal to issue QSLs under certain circumstances may lead to disqualification. Complaints relating to monetary issues involved in QSLing will generally not be considered, however.

13. Each DXCC applicant, by applying, or submitting documentation, stipulates to:

a) Having observed all pertinent governmental regulations for Amateur Radio in the country or countries concerned.

b) Having observed all DXCC rules.

c) Being bound by the DXCC rules.

d) Being bound by the decisions of the ARRL Awards Committee.

14. All DXCC applications (for both new awards and endorsements) must include sufficient funds to cover the cost of returning all confirmations (QSL cards) via the method selected. Funds must be in US dollars using US currency, check or money order made payable to the ARRL, or International Reply Coupons (IRCs). Address all correspondence and inquiries relating to the various DXCC awards and all applications to: ARRL Headquarters, DXCC Desk, 225 Main St., Newington, CT 06111, USA.

15. Fees.

Effective October 1, 1990, all amateurs applying for their very first DXCC Award will be charged a one-time registration fee of $10.00. This same fee applies to both ARRL members and foreign non-members, and both will receive one DXCC certificate and a DXCC pin. Applicants must provide funds for postage charges for QSL return.

a) A $10.00 shipping and handling fee will be charged for each additional DXCC certificate issued, whether new or replacement. A DXCC pin will be included with each certificate.

b) Endorsements and new applications may be presented in person at ARRL HQ, and at certain ARRL conventions. When presented in this manner, such applications shall be limited to 120 QSOs maximum, and a $5.00 handling charge will apply, in addition to other applicable fees.

c) Each ARRL member will be charged $10.00 for the first submission of the year, up to 120 QSOs and return postage.

d) A $0.15 fee will be charged for each QSO credited beyond the limits described in 15. b), 15. c), and 15. f).

e) Foreign non-ARRL members will be charged a $20.00 DXCC Award fee for their first yearly submission, in addition to return postage charges. Fees in 15. a), 15. b), and 15. d), and 15. f) also apply.

f) DXCC participants who wish to submit more than once per calendar year will be charged a DXCC fee for each additional submission made during the remainder of the calendar year. These fees are dependent upon membership status: ARRL Members: $20.00 (for the first 100 QSOs) Foreign non-members: $30.00 (for the first 100 QSOs). Additionally, return postage must be provided by applicant, and charges from 15. a), 15. b) and 15. d) also.

16. The ARRL DX Advisory Committee (DXAC) requests your comments and suggestions for improving DXCC. Address correspondence, including

petitions for new listing consideration, to ARRL Headquarters, DXAC, 225 Main St., Newington, CT 06111, USA. The DXAC may be contacted by e-mail to dxac@arrl.org. Note that this address is valid for the DXAC only. Correspondence on routine DXCC matters should be addressed to the DXCC Desk, or by e-mail to dxcc@arrl.org.

SECTION II. DXCC LIST CRITERIA

Introduction:

The ARRL DXCC List is the result of progressive changes in DXing since 1945. Each Entity on the DXCC List contains some definable political or geographical distinctiveness. While the general policy for qualifying Entities for the DXCC List has remained the same, there has been gradual evolution in the specific details of criteria which are used to test Entities for their qualifications. The full DXCC List does not conform completely with current criteria, for some of the listings were recognized from pre-WWII or were accredited with earlier versions of the criteria. In order to maintain continuity with the past, as well as to maintain a robust DXCC List, all Entities on the List at the time the 1998 revision became effective were retained.

Definitions:

Certain terms occur frequently in the DXCC criteria and are listed here. Not all of the definitions given are used directly in the criteria, but are listed in anticipation of their future use.

Entity: A listing on the DXCC List; a counter for DXCC awards. Previously denoted a DXCC "Country."

Event: An historical occurrence, such as date of admission to UN, ITU, or IARU, that may be used in determining listing status.

Event Date: The date an Event occurs. This is the Start Date of all Event Entities.

Event Entity: An Entity created as the result of the occurrence of an Event.

Discovery Entity: An Entity "Discovered" after the listing is complete. This applies only to Geographic Entities, and may occur after a future rule change, or after an Event has changed its status.

Discovery Date: Date of the rule change or Event which prompts addition of the Entity. This is the Start Date for a Discovery Entity.

Original Listing: An Entity which was on the DXCC List at the time of inception.

Start Date: The date after which confirmed two-way contact credits may be counted for DXCC awards.

Add Date: The date when the Entity will be added to the List, and cards will be accepted. This date is for administrative purposes only, and will

occur after the Start Date.

Island: A naturally formed area of land surrounded by water, the surface of which is above water at high tide. For the purposes of this award, it must consist of connected land, of which at least two surface points must be separated from each other by not less than 100 meters measured in a straight line from point to point. All of the connected land must be above the high tide mark, as demonstrated on a chart of sufficient scale. For the purposes of this award, any island, reef, or rocks of less than this size shall not be considered in the application of the water separation criteria described in Part 2 of the criteria.

Criteria:

Additions to the DXCC List may be made from time to time as world conditions dictate. Entities may also be removed from the List as a result of political or geographic change. Entities removed from the List may be returned to the List in the future, should they requalify under this criteria. However, an Entity requalified does so as a totally new Entity, not as a reinstated old one.

For inclusion in the DXCC List, conditions as set out below must be met. Listing is not contingent upon whether operation has occurred or will occur, but only upon the qualifications of the Entity.

There are five parts to the criteria, as follows:

1. Political Entities
2. Geographical Entities
3. Special Areas
4. Ineligible Areas
5. Removal Criteria

1. Political Entities:

Political Entities are those areas which are separated by reason of government or political division. They generally contain an indigenous population which is not predominantly composed of military or scientific personnel.

An Entity will be added to the DXCC List as a Political Entity if it meets any one of the following three criteria:

a) The entity is a UN Member State.

b) The entity has been assigned a callsign prefix bloc by the ITU . A provisional prefix bloc assignment may be made by the Secretary General of ITU. Should such provisional assignments not be ratified later by the full ITU, the Entity will be removed from the DXCC List.

c) The Entity has a separate IARU Member Society.

New Entities satisfying any one or more of the three conditions above will be added to the DXCC List by administrative action as of their "Event

Date."

Entities qualifying under this section will be referred to as the "Parent" when considering separation under the section "Geographical Separation." Only Entities in this group will be acceptable as a Parent for separation purposes.

2. Geographic Separation Entity:

A Geographic Separation Entity may result when a single Political Entity is physically separated into two or more parts. The part of such a Political Entity that contains the capital city is considered the Parent for tests under these criteria. One or more of the remaining parts resulting from the separation may then qualify for separate status as a DXCC Entity if they satisfy paragraph a) or b) of the Geographic Separation Criteria, as follows.

a) Land Areas:

A new Entity results when part of a DXCC Entity is separated from its Parent by 100 kilometers or more of land of another DXCC Entity. Inland waters may be included in the measurement. The test for separation into two areas requires that a line drawn along a great circle in any direction from any part of the proposed Entity must not touch the Parent before crossing 100 kilometers of the intervening DXCC Entity.

b) Island Areas:

A new Entity results in the case of an island under the following conditions:

i) The island is separated from its Parent by 350 kilometers or more. Measurement of islands in a group begins with measurement from the island containing the capital city. Only one Entity of this type may be attached to any Parent.

ii) The island is separated from its Parent by 350 kilometers or more, and from any other island attached to that Parent in the same or a different island group by 800 kilometers or more.

iii) The island is separated from its Parent by intervening land or islands that are part of another DXCC Entity, such that a line drawn along a great circle in any direction from any part of the island does not touch the Parent before touching the intervening DXCC Entity. There is no minimum separation distance under this section.

3. Special Areas:

The Special Areas listed here may not be divided into additional Entities under the DXCC Rules. None of these constitute a Parent Entity, and none creates a precedent for the addition of similar or additional Entities.

a) The International Telecommunications Union in Geneva (4U1ITU) shall, because of its significance to world telecommunications, be considered as a

Special Entity. No additional UN locations will be considered under this ruling.

b) The Antarctic Treaty, signed on 1 December 1959 and entered into force on 23 June 1961, establishes the legal framework for the management of Antarctica. The treaty covers, as stated in Article 6, all land and ice shelves below 60 degrees South. This area is known as the Antarctic Treaty Zone. Article 4 establishes that parties to the treaty will not recognize, dispute, or establish territorial claims and that they will assert no new claims while the treaty is in force. Under Article 10, the treaty States will discourage activities by any country in Antarctica that are contrary to the terms of the treaty. In view of these Treaty provisions, no new Entities below 60 degrees South will be added to the DXCC List as long as the Treaty remains in force.

c) The Spratly Islands, due to the nature of conflicting claims, and without recognizing or refuting any claim, is recognized as a Special Entity. Operations from this area will be accepted with the necessary permissions issued by an occupying Entity. Operations without such permissions, such as with a self-assigned (e.g., 1S) callsign, will not be recognized for DXCC credit.

d) Control of Western Sahara (S0) is currently at issue between Morocco and the indigenous population. The UN has stationed a peacekeeping force there. Until the sovereignty issue is settled, only operations licensed by the RASD shall count for DXCC purposes.

e) Entities on the 1997 DXCC List that do not qualify under the current criteria remain as long as they retain the status under which they were originally added. A change in that status will result in a review in accordance with Rule 5 of this Section.

4. Ineligible Areas:

a) Areas having the following characteristics are not eligible for inclusion on the DXCC List, and are considered as part of the host Entity for DXCC purposes:

i) Any extraterritorial legal Entity of any nature including, but not limited to, embassies, consulates, monuments, offices of the United Nations agencies or related organizations, other inter-governmental organizations or diplomatic missions;

ii) Any area with limited sovereignty or ceremonial status, such as monuments, indigenous areas, reservations, and homelands.

iii) Any area classified as a Demilitarized Zone, Neutral Zone or Buffer Zone.

b) Any area which is unclaimed or not owned by any recognized government is not eligible for inclusion on the DXCC List and will not count for DXCC purposes.

5. Removal Criteria:

a) An Entity may be removed from the List if it no longer satisfies the criteria under which it was added. However, if the Entity continues to meet one or more currently existing rules, it will remain on the List.

b) An Entity may be removed from the List if it was added to the List:
i) Based on a factual error (Examples of factual errors include inaccurate measurements, or observations from incomplete, inaccurate or outdated charts or maps); and
ii) The error was made less than five years earlier than its proposed removal date.

c) A change in the DXCC Criteria shall not affect the status of any Entity on the DXCC List at the time of the change. In other words, criteria changes will not be applied retroactively to Entities on the List.

SECTION III. ACCREDITATION CRITERIA

1. Each nation of the world manages its telecommunications affairs differently. Therefore, a rigid, universal accreditation procedure cannot be applied in all situations. During more than 50 years of DXCC administration, basic standards have evolved in establishing the legitimacy of an operation.
It is the purpose of this section to establish guidelines that will assure that DXCC credit is given only for contacts with operations that are conducted with proper licensing and have established a legitimate physical presence within the Entity to be credited. Any operation that satisfies these conditions (in addition to the applicable elements of SECTION I., Rules 6, 7, 8, and 9) will be accredited. It is the intent of the DXCC administration to be guided by the actions of sovereign nations when considering the accreditation of amateur radio operation within their jurisdiction. DXCC will be reasonably flexible in reviewing licensing documentation. Conversely, findings by a host government indicating non-compliance with their amateur radio regulations may cause denial or revocation of accreditation.

2. The following points should be of particular interest to those seeking accreditation for a DX operation:

a) The vast majority of operations are accredited routinely without a requirement for the submission of authenticating documentation. However, all such documents should be retained by the operator in the unlikely event of a protest.

b) In countries where Amateur Radio operation has not been permitted or has been
suspended or where some reluctance to authorize amateur stations has been noted, authenticating documents may be required before accrediting an operation.

c) Special permission may be required from a governmental agency or private party before entering certain DXCC Entities for the purpose of conducting amateur radio operations even though the Entity is part of a country with no amateur radio restrictions. Examples of such Entities are Desecheo I. (KP5); Palmyra I. (KH5); and Glorioso Islands (FR/G).

3) For those cases where supporting documentation is required, the following can be used as a guide to identify those documents necessary for accreditation.

a) Photocopy of license or operating authorization.

b) Photocopy of passport entry and exit stamps.

c) For islands, a landing permit and a signed statement of the transporting ship's, boat's, or aircraft's captain, showing all pertinent data, such as date, place of landing, etc.

d) For locations where special permission is known to be required to gain access, evidence of this permission must be presented.

4) These accreditation requirements are intended to preserve the integrity of the DXCC program and to ensure that the program does not encourage amateurs to "bend the rules" in their enthusiasm, possibly jeopardizing the future development of Amateur Radio. Every effort will be made to apply these criteria uniformly and to make a determination consistent with these objectives.

SECTION IV. FIELD CHECKING OF QSL CARDS

QSL cards for new DXCC awards and endorsements may be checked by two DXCC Field Representatives. This program applies to any DXCC award for an individual or station. Specifically excluded from this program are 6-meter, 2-meter, Satellite DXCC and all 160-meter QSLs.

1) Countries Eligible for Field Checking:

a) Eligible countries will be indicated in the ARRL DXCC Countries List, and are subject to change. Only cards from these eligible countries may be checked by DXCC Field Representatives. QSLs for other DXCC countries must be submitted directly to ARRL Headquarters.

b) The ARRL Awards Committee determines which countries are eligible for Field Checking.

2) DXCC Field Representatives:

a) DXCC Field Representatives must be ARRL members who have a DXCC award endorsed for at least 300 countries.

b) To become a DXCC Field Representative, a person must be nominated by a DX club. (A DX club is an ARRL affiliated club with at least 25 members who are DXCC members and which has, as its primary interest, DX. If there are any questions regarding the validity of a DX club, the issue shall be determined by the Division Director where the DX club is located.) A person does not have to be a member to be nominated by a DX club.

c) DXCC Field Representatives are approved by the Director of the ARRL Division in which they reside and appointed by the President of the ARRL.

d) DXCC Field Representative appointments must be renewed annually.

3) Card Checking Process:

a) Only cards from the list of eligible countries can be checked by DXCC Field Representatives. An application for a new award shall contain a minimum of 100 QSL confirmations from the list and shall not contain any QSLs from countries that are not on the list of eligible countries. Additional cards should not be sent to HQ with field checked applications. The application may contain the maximum number of countries that appear on the list of eligible countries. That is, if there are 245 countries on the list, field-checked applications could contain 245 countries.

b) It is the applicant's responsibility to get cards to and from the DXCC Field Representatives.

c) Field Representatives may, at their own discretion, handle members' cards by mail.

d) The ARRL is not responsible for cards handled by DXCC Field Representatives and will not honor any claims.

e) The QSL cards must be checked by two DXCC Field Representatives.

f) The applicant and both DXCC Field Representatives must sign the application form. (See Section I no. 11 regarding altered, forged or otherwise invalid confirmations.)

g) The applicant shall provide a stamped no. 10 envelope (business size) addressed to ARRL HQ to the DXCC Field Representatives. The applicant shall also provide the applicable fees (check or money order payable to ARRL-no cash).

h) The DXCC Field Representatives will forward completed applications and appropriate fee(s) to ARRL HQ.

4) ARRL HQ involvement in the card checking process:

a) ARRL HQ staff will receive field-checked applications, enter application data into DXCC records and issue DXCC credits and awards as appropriate.

b) ARRL HQ staff will perform random audits of applications. Applicants or members may be requested to forward cards to HQ for checking before or after credit is issued.

c) The applicant and both DXCC Field Representatives will be advised of any errors or discrepancies encountered by ARRL staff.

d) ARRL HQ staff provides instructions and guidelines to DXCC Field Representatives.

5) Applicants and DXCC members may send cards to ARRL Headquarters at any time for review or recheck if the individual feels that an incorrect determination has been made.

You cant...ALTHOUGH I agree that having them on standard
chanels would be nice (Texas is a 20Khz state and we have
people who still have 30 Khz channels in their older xtalled
rigs like 146.49, 6.55, etc), it is not against the law at all
for them to chose ANY freq in the simplex ranges....as long as
they dont deliberately interfer with someone...you COULD ask
them to move up or down IF they are inteferring...
otherwise, good luck...

2041. Re: Elmer needed for 6 meters

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-22 00:00:00 UTC
From: "Christopher (Chris) W. Boone" <cboone@earthlink.net>
Message-ID: <34C80718.38C92EF@earthlink.net>
Source record: 180866

Stuart,
welcome to the wonderful band of 6mtrs!!!

Here are some tips for ya..

CW Beacons are usually around 50.066 Mhz
SSB is 50.1 to 50.25 with most calling on 50.110 and 50.125
and some on 50.2...
AM is on 50.4

RC models hang out on 50.8 to 51 Mhz...PLEASE STAY AWAY from this
area....you could crash a plane into something....or someONE!

FM is 51-54 Mhz with 52.525 being the simplex channel...
Not sure of the rptr situation in your area....look in
the ARRL rptr directory or give a holler on 52.525 simplex.

Hope that helps a little!!!
There is one book out by Gordon West on 6 ....other than his
S CA influence on the 6mtr FM band listing in the book (which
is thankfully NOT correct for the rest of the country), it is
a good one to read....

BTW the major rptr offsets on 6 are:
-1 MHz odd channels (53.01 - 53.99 outputs) Most of 6mtr rptrs still
here
-1.7 MHz off channels (same as above...NW US uses this a lot)
+500Khz even channels (51.02 and up) S CA and few other states...

Hi Mike:

Zero beat, in the case of a crystal calibrator means that you are 'zero' cycles off frequency from the 100KHz marker.
As your tuning down you'll hear the pitch get lower and lower, when the tone gets below 30 cycles or so turn the volume up and continue tuning, you can actually hear the speaker pumping when you get down to 2 or 3 cycles off frequency. When there is no movement or sound your at zero beat or in other words your VFO is exactly on a 100KHz divison.

To think of it in other terms, if you put an audio frequency meter on your speaker and tuned for 1000 hz tone, your frequency would be exactly 1000 hz or 1KHz off frequency. Keep in mind when your operating CW, you want to zero beat the other station so that your calling him on the exact same frequency. Where it gets tricky is many trancievers automatically shift your transmit frequency so if your listening to station and have his signal tuned to give you a 1000Hz tone and your on 7.105 then your transmit frequency will be 7.104. Hope this helps. Have fun with the Yaesu.

Sorry, Ed, but the implication was not that the mere presense of a codeless
license increased the number of hams, but that the number of hams would
not have increased if it were not for the codeless license. That
implication is simply false, demonstrable with FCC statistics.

Telegraph Served AP for 8 Decades

By LIBBY QUAID Associated Press Writer

WASHINGTON (AP) -- The Associated Press once had an army of 1,500 telegraphers who spread the news to the world in staccato bursts.

``There's only four of us left,'' says Aubrey Keel, whose career spanned bureaus from coast to coast and whose world was the 46 combinations of dots and dashes that made up Morse Code.

For the eight decades the news cooperative depended upon the telegraph, a good fist was in demand. His own could tap out up to 45 words a minute, the 96-year-old Keel boasted as he demonstrated his trade Wednesday as part of the AP's 150th anniversary observation at The Freedom Forum's Newseum, a museum in the Washington suburb of Arlington, Va.

From his home in Kansas City, Mo., Keel brought the tools that once ruled the business -- a vintage green Western Union telegraph like the machine he started on, and a Vibroplex ``lightning bug'' that is still made today.

Smoothly, swiftly, he flicked his wrist, and the ``dahditditdidahdahdididit'' became verse received by a retired Illinois railroad telegrapher, George Nixon, seated with his own machine in the back of the room:

``Along the smooth and slender wires, the sleepless heralds run. Fast as the clear and living rays go streaming from the sun. No pearls of flashes, heard or seen, their wondrous flight betray. And yet their words are quickly caught, in cities far away.''

Keel recalls the words flashing over the wire as the stock market crashed in 1929, and as baseball play-by-play and stock quotations flowed across. Trained telegraphers were at either end of the wire, one to translate words into dots and dashes and transmit them, the other with earphones and a typewriter at the other end to translate the dots and dashes into words.

And they had to know three ``languages'' of Morse Code; American, International and Continental (created because the space letters C, O, R, Y and Z and the long L couldn't transmit along submarine cables) as well as Phillips Code, a shorthand version of Morse.

First recruited by the railroads during a telegrapher shortage in World War I, Keel took years to develop the skill that now comes so easily.

``I don't know how else to explain it. After you do it for a while, it's like music,'' Keel said. ``It's like riding a bicycle or playing the piano. You get rusty at it, but you don't forget it.''

Fellow operators worked for railroads, post offices, pumping stations, large companies, boards of trade -- and Western Union paid extra for ``bonus'' operators who could take messages on a faster, hot wire.

But the newspaper telegraphers ``had it made,'' Keel said. When he was hired by the AP in Lubbock, Texas, Keel made $32.60 a week for 48 hours of work. The average railroad salary was about $25, he said.

Older operators had a reputation for hard living, but Keel had learned his lesson as a novice in an earlier job. It was Prohibition, and he decided to drink a bottle of home brew with his more experienced colleagues.

``I came back, and the wire started up -- I could hear it, but I couldn't get it down,'' Keel said. ``You never saw a man sober up as fast as I did.''

He remembers when the Texas AP phased in the Teletype printer in 1928, letting 30 operators go in one day. ``Someone said, `Those Teletypes will never work, they'll have us back in a week,''' Keel recalled.

But they didn't. Keel weathered the storm, eventually becoming communications chief in the Milwaukee, Des Moines and Los Angeles bureaus. He retired in 1966.

Today, he often ``talks'' to retired telegraphers transmitting via ham radio -- unless he's busy using e-mail from a home command center that includes two computers, radio gear and a digital camera and scanner. His old employer now transmits news at 9,000 words a minute.

He glanced down at his old ``green key,'' adjusting the Prince Albert tobacco can that changes the telegraph's pitch.

``It's hard to think that AP started and for 80 years, that was their means of communication. And look at what they are today,'' he said.

Hi John
I am no chemist on gel cells but if you use your browzer and do a
search for 'gel cells' , don't forget to use the quots since you are
dealing with more than one word, you might find some website with
information on gel cells.
I have a number of sealed lead acid cells and the various sources I
have read and/or delt with tell me that those kind of cells don't like
to be discharged or left on a shelf for any prolonged period of time.
If you have any gel cells or similar batteries might I suggest that
you periodically charge and discharge and recharge them. These type
of cells 'don't' like to be left on the shelf or left discharged. To
some degree they are opposite to nicad batteries.

That was my point Cecil, the groundwork for the situation we are facing today in Amateur Radio was laid long before the No code liscenses even existed. I wonder if those same Amateurs that lied about using CW back then in order to keep their liscense are fighting to keep it as a requirement today. If they are then the CW requirements are exactly what many people believe they are Filters to restrict access to the HF bands. Clinging to 30 year old CW requirements and rules and regulations that are slowly strangling the ARS just doesn't make sense to many of us, who came into Amateur Radio later.

Can anyone help me out? I just got a used VX-1R and I am having a few problems. First the Priority Channel does not seem to work right. If I am in the Ham VHF Band and it is receiving it will not go and check the priority channel (in the ham uhf band). Do I have something set wrong? I also wanted to know If I could do a cross-band split. I just found out that there are differnt versions. I heard someone sent theirs to upgrade the CPU. Can this be done? Is here any reason to do so? Will the adams software do anything for me? This unit must have been moded. It RX's the cell band and TX's all over the place. I think it is the A102 model. Can the mods be done on the newer versions?

Can anyone help???

It would take at least three (or more) over the main part of the USA
to do much damage.

Arafat was heard to say a few days ago that they (Palastines) would
fight over Jeuruselm for their capitol. The Christian world will never
surrender the home of christians to the Arabs. The bibble predicts
that the Battle of Armagenton will be fought over the city, and that
god would eventually intervene to save the city for Christians. If by
some chance the arabs got hold of one of those devices and destroyed
the city, I would expect Christians around the world would be so upset
that they would hunt down every arab they could find, just like the
Jews hunted down the Nazis after WWII.

>renewing their amateur tickets, once the initial rounds of those licenses
>come up for renewal.

On this point, Michael has some degree of historic perspective
to base his assertion on. For a 5 year period we saw NO licenses
at any level expire and the numbers of hams grew as new hams were
added, but none deleted. The nocode tech license has yet to see
even the first such license reach the 10 year renewal point.

When they do, we'll likly see an even lower set of ham numbers
than we have for the past 12 months. It will be very interesting
to watch exactly what happens.

>>Undoubtedly they
>>realized that the code was discouraging too many folks from finding out
>>what ham radio was all about, and from discovering the self-satisfying
>>pay-off amateur radio offers us.

>Maybe, but only renewal statistics will tell for sure.

On that we can agree, and time will be the final arbiter
of the statistics.

Bill:
The other postings are correct; CB is CB. An amateur license is not relevant.

However, I am wondering if your 23 channel CB radio has SSB, or are you going to take an amateur transmitter down there?

By the way, the SSB operators are on the upper four channels. You will not find much, if any, SSB operation on ch. 1 thru 23. You probably will annoy a bunch of folks by using it there. Just an observation.

>>send at 13 or better, but cannot copy faster than 9-10.

I hear this kind of comment a lot. Let me throw in an observation from having been a professional telegrapher:

A good operator takes great pride in his sending. Part of developing a "near perfect" fist is the ability to copy your own transmissions....either "real time" or via a recorder.

If you exceed your receiving speed by a significant margin, you cannot monitor your own sending to a high degree. Really smooth, accurate sending is difficult to achieve and requires a lot of practice, just like receiving.

Personally, I can copy about 45 WPM, using a typewrite or computer terminal. (Somewhat higher if I don't have to write it down). However, after more than three decades of CW experience, often at 8 hours a day for five to six days a week, I can't send clean code any faster than 30/35 WPM.

I'll be the first to admit that there is a lot of difference between commercial and Amateur CW work. For one thing, 100% accuracy seldom is a matter of life and death in Amateur work. You can miss a lot, or mangle the transmission, and no harm is done. Nevertheless, clean sending is something for which all of us should strive--even in a hobby. The ham on the other end will appreciate you, for sure! Keeping your transmitting speed in check will produce a lot of compliments from your QSOs.

Besides, if you go back to a station at 15 WPM, he will take his speed cue from you. If you copy only 10, you've got a problem.

The term "HAM" might have originated as the initials of the radio pioneers,
Hertz, Armstrong, and Marconi. A more likely explanation is that it is the
British pronounciation of the word "Amateur", or "Ams" as they once were
called.

No more divisive than the Morse code battle, which has clearly polarized amateurs into competing groups of "us vs them."

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

What battle is that? I am not aware of one. We have plenty of activities for both CW buffs like myself, and for those who don't care for it. There's room for any ham of any level of skill, knowledge, or equipment budget on the bands.

By the way, I have only been active on the internet a few weeks, but I have noticed a lot of ham and CW related posts from you, and I was curious whether you are a ham or not; and of not, exactly what your concern is all about. I'm not saying non-hams shouldn't post here... far from it. I just don't understand why a non-ham would bother heckling the CW community, nor why he would bother trying to fan the very flames of controversy he complains about. I probably missed something important that was discussed before I found these ngs, and would appreciate being brought up to speed.

If you actually are a ham, why don't you sign with your call? Most every other ham here does, if it is not included in their screen name or e-mail address. Seems like a nice courtesy on such a ham-oriented ng. Kind of a unifying thing.

Did I read this right ?

Curtis .. N5HDQ .. http://wf.quik.com/n5hdq

>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Yes, I think you did, Curtis, though I am unsure whether you got the point or not. The point is that to separate Novs and Techs from mainstream amateur radio and to require that they be represented separately and only by others of their license class would, IN GENERAL, ensure that they are not represented by as knowledgeable a group of leaders as would be found in Amateur radio when taken as a whole, and divide our ranks needlessly. Zeroing on two snips and diplaying them out of context, then remarking on the then apparent incongruity does indeed make one question whether he read correctly, and it SHOULD beg the question.

I realize that there are indeed some no-code techs out there who have dealt with CCRs, zoning ordinances, Interference complaints, etc, and given good account of themselves. I understand that many new hams are active in public service activities on the air, and many have great technical skills and are generally very considerate ops. I know that some techs out there have operated in every legal mode that we have, with equipment that they built themselves. Generally, though, limiting an office to one class of licensee will be detrimental to having a well-rounded and capable individual in office. (If you take the above statement out of context, please include the qualifier "generally" in the snip, as I know quite well that the statement is incorrect without it.)

I stand by my premise that it is folly to divide hams up into their license categories and mandate different qualificaton levels to their representatives. I see no purpose served but a fair amount of potential harm.

Read this newsgroup lately? The lines are clearly drawn. You'll also hear it on your local repeaters. Coders vs no-coders, older hams who "refuse to talk to no-coders", etc. On HF, the insulting comments directed towards technicians is even worse.

>
>By the way, I have only been active on the internet a few weeks, but I have

Yes, I hold a valid amateur radio license with HF privileges. No, I am not an active ham. I was bored to tears by most of the drivel I heard on the bands. The Internet is much more effective, modern, and entertaining as a communications hobby.

>I'm

Not a wise move with this bunch. There have been several instances of harrassment directed towards various participants of the radio newsgroups in the past by those who hold differing opinions. Witness the endless flamefest with Bill Cheek, John Mackey, and friends on rec.radio.scanner. It's much safer to remain anonymous...and it's perfectly acceptable to do so. No license or callsign is required to participate on USENET.

Well that is tru that you can 'prop' the system but the avionics has
nothing,with it, unless they are forced by others to do so.

>
>
> As far as causing interference to aircraft radios and other avionics,

I Europe we use GSM cellular system and its spectral is not niceinspite
of what some authoriteis say.
Even if they are below some limits they send more rubish
the an HT. It is a difference to be close to limit at one
harmonic freq and on 2000 freq. Some 'junk' made electronics
do not like that. The planes are not usually junk
but one must be very careful with them anyway.

> In some newer aircraft, there is a third concern. Newer aircraft are
> adopting fly by wire control systems. If these are confused by

> the ground without the pilot being able to do anything about it.
> Operating
> unauthorized electronics of any sort on an aircraft is not just
> stupid, it is
> criminally stupid.

The Boeing 777 can handle this but not the AirBus. Why???Well the Boeing
took in use 'flight by wire' later then the AirBus
did and learned on some problems the AirBus had on landing
apraoch in some cases. Not officaial

The 777 has a PFC disconnect switch which goes directly to
ACEs (Actuator Control Electronic) and the pilot
can overide the system in emergancy sistuations
by disconnecting the PFCs(Primary Flight
Computers).
(Best to not to test this functionality buy using
an HT or a Cell Phone...)
The 777 PFC has 9 microcontrollers geathered
in three groups placed in different places on the
plane. In each group there are 3 microcontrolers
which are from three different suppliers
running the same software compiled using
three different compiler vendors.
And you only need one controller to fly.
But you need two or three to take off.
Only one controller is a master at a
moment and alle the others check him.
If he does do stupid things he gets killed
by his brothers. (Nice system why
politicions do not have the same...)
and a new master taks over.Which one?
does not metter they do not get paid
for the job.

All PFC are bound togather with each other
and the rest with a triple ARINC 629
communication bus which run through different parts of
the plane.

too much are-plane stuff, i go back to radio.

Piotr

>>
Greetings- I was going to look in the rec.radio.amateur FAQs, but thought I'd ask for anybody's personal experience on this.

I was wondering how long it took from the time I passed my tech exam, to the time my name and new call sign would be posted in the FCC database. I took the test this past Sunday 1/18 in Yonkers, New York. Monday was a holiday, so I suspect the FCC offices were closed.

In addition, are there any recommendations on a dual band HT for a first-timer?

Thanks for any info!
Alan Kaufman

>>

I bet it's there today or tomorrow at the latest if the VE team is on the ball. I like the new system... I was sure anxious waiting for my first license. I already had a station... a Radio Shack receiver and a two transistor transmitter cookbook homebrewed from one of Doug Demaw's books. T/R switching via alligator clips. I was ready to go on the air, and I couldn't cuz I had to wait for that stinkin license, and mail delivery and forwarding was touch and go as I was at sea.

In answer to your request for suggestions on a HT, it is hard to really make a recommendation without knowing what activities you want to try, what size is acceptable, whether there are repeaters nearby, what your budget looks like, whether there is a ham radio shop close by, whether you are willing do deal through the mail, etc. I have a HTX-202 which though fairly bulky, can be used split, with PL/CTSS, has pretty fair memory features, didn't cost an arm and a leg, and I could buy it at the nearest mall. Like most HTs, it doesn't do CW. Output varies with the DC power source... I think 7 watts max with 13,8 VDC. Battery pack gives a bit less.

Most serious VHFers will find a LOT lacking in this HT, but since I wasn't really certain I would use VHF very much, and since that actually proved to be the case, I am glad that I bought an inexpensive rig that is recognizeable enough to sell easily should I decide to part with it. Had I gotten bit by the FM bug, I would probably have upgraded post haste to a nice shirt-pocket-size dual-bander or a powerful base set that does everything but tell me what to say and who to talk to, and I would have possibly regretted somewhat my choice for my first VHF rig.

A good approach is to read the ads in the ham mags for all the current products and ask for personal opinions on the ones that seem to be what you're looking for. That way, you will get more speciific information from owners both satisfied and not, of specific rigs.

Congragulations on passing, by the way! That should have been the first thingI mentioned.

Have you gotten involved with your local ham club? The OMs there might prove a valuable source of info, not to mention a source of used gear. Seems like the clubs are really big on VHF/UHF lately as no-code Techs make their presence felt in the ham community. HT users and V/UHF mobileers are, as a whole, more club oriented since this makes it easier to share the costs of building and maintaining a repeater. You will probably find other new hams with your interests, questions, and concerns, along with the OMs who have been there/done that and are ready to share what they have learned.

Good luck with your HT shopping, Alan

2079. Re: FCC Database

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-22 00:00:00 UTC
From: ritzman@aol.com
Message-ID: <19980122114301.GAA29053@ladder01.news.aol.com>
Source record: 180982

Dear Alan:

Congratulations on your exam. Like you I recently passed my test (January 11th) and I found it took about ten days for the database to show my callsign. It seems that the FCC database posting is a little irregular with little or no activity somedays, quite a bit on others. In any event you should have a call sign within the next few days!

Regarding your first rig, I went with a Radio Shack HTX 202 handheld. I based my decision on several factors,
1. Simplicity. The 202 has good basic features without going overboard. The last thing I wanted was to be mired in complicated programming just to get on the air.
2. Construction. The 202 is built like a tank. Very heavy chassis, solid controls, etc.
3. Good reputation. A search of Dejanews revealed that the radio has a pretty good operational history and is highly regarded by most hams as a simple utility HT.
4. Availibiltiy & Return Policy. RS has a 30 cash back return policy which allowed me to purchase the radio and try it out to see if it really met my needs. In addition, the store is right down the street if I ever need service or to swap out the unit.

So far I love the rig, I have had very good success with all our local repeaters using only the supplied rubber duck antenna. Last night I built a simple 1/4 ground plane from a chassis mount VHF connector (SO-239?) and the range is extremely good. I am able to solidly hit a repeater some 25 mile away using about 4 watts of output. The only complaint I have is that the documentation supplied with the radio is terrible. You'll need to spend few minutes interpreting the manual before you're completely up and running.

The bottom line, I recommend the radio highly as a first rig. Also, there are a ton of them out there for sale used for anywhere from a $100 on up if you want to save a few dollars.

Alan if you have any questions feel free to drop me a line. Welcome to the hobby, I hope you enjoy it as much as I have!

Hi Curtis, when the penality for doing something right and doing something wrong are exactly the same, there is incentive to do the something wrong and hope one doesn't get caught. Like the Morse code testing requirement of today, it was an unnecessary federal governmental regulation. That it was unnecessary and unimportant is proven by the fact that it doesn't exist now. There has been a law against murder ever since laws existed and there still is. ARS regulations come and go according to the whims of the FCC/ARRL. Why do you suppose there are no extra-only phone privileges on 40m?

Jeremy,

Several years back the First Class license was combined with the Second Class license, and called the General Radiotelephone license. I had a First Phone, and now have a lifetime General Radiotelephone license. I believe that is what you are looking to get. I got my First Phone back in early 1959, so I don't know where to get schooling, but there should be study books available, and in electronic magazines, look for ads for schooling.

I used mine in the broadcast field, but it isn't required now. Anyone with a restricted permit
can call themselves a "Chief" engineer. That's why I went into real estate.

Ideally, he/she would learn of the voluntary band plans from the
instructors and/or the books used to study for the tech exam. IMHO, any
new amateur who doesn't learn of voluntary band plans by independent
means is not very interested in the amateur radio service

>just who will be around to work after a large strike, but I don't know
>everything!

Absolutely true. The MIGs up through the 25s had all their avionics built
with tubes. There were 2 schools of thought on this point:

1) The Russians are dumber than us and can't make/don't have the solid state
stuff

2) The Russians are smarter than us cuz they'll have planes in the air when
all our planes have crashed

Not that having planes in the air would do *anyone* any good after a massive
exchange involving ~28,000 warheads with yields of 500 Ktons and up......

Source record: 180742

I live in a one story house and would like to run a wire antenna between the eve of my house and a decent size tree on my lot. I was hoping that there exists a good design which would allow me to end feed the antenna from my house vice the middle (in the case of a dipole). A straight long wire is out of the question because I don't think I could provide it a good enough ground. I've heard of a design called the Zepplin. Any suggestions on Web sites or designs. 10 meters opened up the other day and on a cheesy homebrew dipole I got out to Texas and Oklahoma from the state of Washington.

```
------------------------------------------------------------
/ INDECENT LANGUAGE HAM RECORDINGS WANTED!
/
------------------------------------------------------------
```

A new ARRL Director who has vowed to take hams who use indecent language off the amateur bands says that he wants tape recordings of alleged offenders sent directly to him. Joe Falcone, N8TI says that he will use the recordings as proof to the FCC that the problem is nationwide in scope.

Specifically, N8TI is looking for good quality off-air cassette tape recordings that clearly demonstrate that a violation has taken place. The
audio quality must be good enough so that anyone hearing the tape will recognize the language being used without the need to replay it a second or third time. This means using a direct connection to your transceiver or receiver.

Also, make certain to label the tape with the alleged offender's name. Include the location the transmission was recorded, the operating frequency of the station, the date, time of day and the name of the person who recorded it.

Send these tapes to :
Joe Falcone, N8TI
9614 Arden Ave.

Occasionally one can be found, but that is mostly rarely on CW in the CW
portion of the band and due to lack of experience and not bad manners.

> > Sure there are bad ops on hf.

Sure... Lots on voice in my findings ---- few on CW likewise.

> > But most of them are on phone not CW.

> how do you swear on CW anyway ?? it's not so easy to transmit your
> feeling against others by the use of CW.

Well, if you KNOW CW, it is not a problem. There are folks that can
rustle up a storm o' #$%&@ swearin' like the bosun in a heavy sea.
But, RARELY, do they swear in vain on the air. In 30 years, I have
only heard one or two cuss like the bosun, and that only for
conversational emphasis.

Also, there is more feeling transmitted via CW than you could ever
imagine. You only need to know and feel the nuances of the operator's
sending to read him like a book. A little of that is lost in the use
of keyers, and most of that is lost in the use of keyboards. But, any
CWist with some time under his belt, can read you like a book. You don't
even need to know a callsign, and you can often tell who the other end
is, merely by the nuances of his code. You can tell what kind of day
he has had, and probably if he has had too much coffee, or a little
too much rum, or the arthritis is settin' in if he is a grand OT.
You just have to learn the art and craft a little to be able to do that.
One has to put in a little time-in-grade to accomplish it. You know,
``the old fashioned way''.

stuff deleted......

> trusting that CW cleans up the jerks is the problem.

Actually, it does. The jerks that don't know CW (OK they all passed some
sort of silly test sometime back in the dark ages), i.e., those that are
proficient to any degree are almost always the non-jerks. Go figure....
that CW filter is working fine..... all the jerks are up on fone.

(I know, that is a tad of bias, but, it HAS been my experiences in 30 yrs.)

As T.O.M. was wont to say.....``enuf said''.

I believe the standard explanations is that in the days of real
"Morse" when they used clickety-clack sounders on landlines, a
green or poor operator placed his "receiver" on a metal tobacco can
with the lid open so he could distinguish his sounder from those
others operating closeby. Hence, the word "lid".

Any other stories?

Your comments are interesting. Back in the 60's and 70's, I was one of the youngest commercial operators in the US. I pounded brass for ITT on ship-to-shore circuits, and it probably was the best job I ever had--from an enjoyment standpoint, as well as salary.

I hate to see it going away---primarily because I think modern communications (satellite, internet) are very "thin" and could be disrupted quite easily. The movie, Fourth of July, played on this idea, with a ham operator using Morse Code sending vital info after every other system "went down".

>> ;-).
>

QST magazine ran several articles on this subject, back when hobby folks worried about it. I have no idea when, but I would guess about a quarter century ago. I think it was QST but could have been 73.

Project "Trestle" was extensively written up in several aviation and electronics publications in the same time frame. Most were professional pubs, but I seem to recall at least one of the popular science/mechanics mags doing a pretty thorough description. I even had a photo of the trestle lying around here for some years - but it's long gone now.

Why not make up characters to indicate upper-case and lower-case, et
cetera, and submit them to the ITU, to be appended to the Morse code?
You can call them the Flack addendums - you might become famous.

If someone is too stupid to read and understand the Truth In Lending statement, they deserve to be socked with a 32% rate. Basic comprehension. The government does not need to engage in hand-holding. Of course, with the dumbed-down schools in this country turning out high-school "graduates" who cannot read a simple sentence, I suppose it's necessary for the government to take care of them.

In a few weeks, we'll be getting W4CRC ready to move to our new location in Melbourne, Florida.

We're thinking about putting on a special event from our original buildings in Melbourne the weekend before we move to the new engineering plant.

The Rodes Blvd. buildings were the first buildings used by Rockwell Collins in Melbourne and it's where a lot of design work went on for product families like Micro Line/Micro Line II and other aircraft radios.

If you'd like to see a special event operation from the buildings where it all began for us here in florida, let us know at

feboyer@collins.rockwell.com

Fred N3QK is collecting responses -- at this exact time we don't have a hard date when the antennas will have to come down, but it will be in the next couple of months.

thanks,

bill newkirk wb9ivr

Hello all,..... Where and how can I get information / training and schooling regarding this license. It is my understanding that this license is required to perform repairs on UHF/VHF base stations and paging terminals. Can someone steer me in the right direction? **** Thanks in advance for your help. **** Jeremy **** KF4RTY

That is a neat story. I have talked to several older hams in the
dallas/ft worth area who were on ship in ww2. They copied better
than 50wpm for their whole shift <4on4off> These guys know code!!!!
It is sad to see the backup comm of the world fail to progress. I must
admit when I first started cw I hated it, now I only dislike it and do
use it occasionally.....but when ssb just cannot get it cw will be
right in there trudgeing away

>Jeff look at the numbers regarding growth and upgrades with an open mind, we
>can't accept figures like those posted for last year and survive or keep
>our spectrum.

HF consists of only 3.75 MHz. We can't keep increasing our numbers
down there year after year without *serious* problems arising. When
I became licensed in '76 the bands were jammed with just (if I recall
correctly) 150K hams. With so "few" back then there was no danger of
losing them, in spite of the cold-war freq'y pressure that existed.

>Many people are crying about Amateurs not being innovative or
>leading in the development of new technology.

Read our history and you'll see that 99.99+% of all amateurs have been
followers, not leaders. You can only name a few dozen amateurs who
really contributed to the advancement of communications; eliminate the
expensive labs and funding their company provided, and the numbers are
much less.

> Many people, who would be interested in Amateur radio are put
>off by the code requirements.

Everything above 50 MHz is available to them. Almost 130 MHz between
6m and 23 cm. No code required. Quite a bit of exploration can be
conducted in that region.

> but we need a constant infusion
>of new people and ideas or the ARS will not be competive with the newer
>technologies.

Ummm, who are we supposed to be competition with? The military? The
maritime service? The telephone industry?

You still haven't shown how the ARS is being "strangled."

Here it is, this just came to me.

I will equate learning the code to when I was a kid and every
Saturday night Momma broke out the old #3 wash tub. I kicked
and screamed and fought it all the way, getting into that tub
to take a bath, but when it was over I felt better.

So grit your teeth, jump in and learn the code.
You will feel beter when it's over.

It might become a habit, the code, after all to this day
I still take a bath every Saturday night.

> I think you are missing the real point. Morse code is a flawed code. No
> upper and lower case, no curly braces, etc., etc. Way too primitive for
> the 21st century.

It is no more flawed than anything else. At what it does it does very
well, and has for 150 years. If it was that flawed, it would have died
out long ago. It has become a bit of a lost art, though, with some
rather dedicated practicioners.

What I was interested in was a way to send morse overlaid on the internet
via packets of some sort so folks could communicate in real time via
morse on their keyboard IF THEY WERE OF AN INTEREST. I dunno if the
windoz boxes would be able to do it, but they might. A unix workstation
should be able to do that in a spare login or window in real time, and
not be too burdened. Since the suggestion of that sort of thing was
made by whoever posted the original input, I thought it might be quite
possible to do, and threw out some ideas for pondering, to see if there
was some real interest or if folks were just trolling.

The simplest approach would be to have an ascii-to-morse converter to
pump the sound output (speaker, soundboard, whatever). It could be
done in real time just like the unix talk, or a chat room.

Although this sort of thing is probably not going to revolutionize
the internet, it would be a good way to do some training for the
unlearned folks that need a little elmerin'. That would always be
good for the service.

> Two suggestions. I think what we should be doing is learning to send ASCII
> or extended ASCII using dits and dahs. All characters would then be 7 or 8
> units long. This would allow us to uuencode pictures of our families and
> not just do the boring: TNX FER CALL OM = UR RST 599 and so on.

I would much prefer something like the latest newsfeed from CNN, the
stock market reports, baseball scores, or the offshore forecast.
If you need to do pictures, use the normal internet functions.

> My second idea is to sample all CW QSO's for one month and come up with
> extended numeric macros. Just as 73 = best regards, #672 would be: NAME HR
> IS DAVE DAVE and #362 would be WELL XYL IS CALLING FOR DINNER SO 73 AND CUL.
> Wouldn't need a PC or UNIX box even. Just a Palm Pilot.

Such a database would be meaningless to almost everyone.

Keyboards on palm boxen are not usable. Too slow for high speed CWists.
You could inteface a good keyboard or a keyer in some way, perhaps, and
us the palm boxen as interfaces to the internet of the future.

> Of course, then we get a lot of folks wanting a No Pilot class of
> license....

Licensing not required for the internet, thus it serves as a useful
training round to conduct ham radio classes, code classes, code
training, etc. I can't think of such interesting uses as these.
One gets very tired of webbing all over the planet in short order.
Time to do something a little better.

Great! The abacus IS quite effective in the hands of a trained operator. Training is not common, these days. Likewise, a slide rule IS quite effective if you know how to run it.....(and its batteries take a long time to die out). Alas, finding a good slide rule these days is difficult. I guess, like my CW, the use of a slide rule is optional. But, you know, for ohms law and related calculations that I can't do offhand in my head, I still reach for the slide rule first. Good tools and methods are always welcome in my shack.... even ancient things like CW and slide rules.....(sadly, I am not a master of the abacus and do have some kudos for those that have mastered the instrument).

Interesting asides..... Bob/NA4G

Hi Gary,
My granddad was a railroad telegrapher. He said that the term lid came from operators who would put the lid of a Prince Albert tobacco tin on the sounder so they could copy the code easier. It was a practice that was frowned on by operators who did not have to do this and it became the slang used for bad operators. They would also say that such an operator had a "tin ear".

There are? Please direct us to any of those translation
programs that can easily and in real time translate Spanish,
French, or any other language into English and also
do English to that other language.

"It" referred to the outdated requirement to swear that one had
been active and could still meet the code requirement in order
to get a license renewed. And my name isn't Carl.

> > There has been a law against murder ever
> > since laws existed and there still is.
>
> Yes, and the point is ?

Necessary requirements have long been requirements and continue
to be requirements. The Morse code requirement is not necessary
in the same way that laws prohibiting murder are necessary.
It is just an FCC/ARRL whim codified into regulations.

The ARS is essentially the only wireless service still using
it and only a minority of hams ever use it anymore.

Do a 100 year time line of the number of services using Morse
code over the years. You will find an ever-decreasing amount
of usage because it is flawed for everything except fun. Fun
can be afforded only by the ARS.

>
>Thanks for giving the guy a honest answer, why does argon help?

Honest question, deserved honest answer.

Argon has a rather high ionization voltage. Has to be dry to keep it that way as any moisture will greatly reduce the voltage needed to get the gas to conduct. I would rather have said that one should use dry Sulfur Hexaflouride because SF6 has the highest ionization voltage of all easily obtainable gases, but SF6 is very much more expensive. Argon makes up a few tenths of a percent of normal air and is a by-product of the industrial production of liquid nitrogen and liquid oxygen. SF6 has to be manufacturered in specially built equipment by reacting sulfur with elemental flourine in a multi-stage process; the SF6 then has to be carefully purified. All this special processing makes SF6 too expensive for 'normal' people.

In any case, the dry Argon fill helps keep the high voltage indiced by the EMP in any metal object from arcing over into the enclosed equipment. If arcing were to occur, it'd be pretty much the same thing as taking a direct lightning strike. Since you can't ground the enclosed equipment, this would negate the original intent, you should have some method to prevent arcing inside the protective enclosure.

The foregoing statement brings up an additinal point that I failed to mention in my original post:

You should suspend the equipment at the center of the enclosure with some suitable non-conducting material, nylon rope would be just fine.

Yea, 11 meters is a contest between 'dumb and dumber', like I head the two 'freebander' stations talking about working dx via skip. One said he never worked dx stations by skip, he only worked them 'direct.'

Almost, but not quite. There is still a fair amount of wireless traffic from places like WCC/WNU/KFS/WLO/CLA and the like, although it is diminishing. The daily WX bcsts still run from WCC/WNU/KFS (try QTR 0350Z QRG 4310KHZ). If the minority uses it, it must be a big minority..... one can always find a lot of folks on CW if one knows where to look and what to listen for. Granted, it is diminishing in use commercially. When that finally goes, the hams will be the last vestage of Morse on the air. I can usually always find any number of hams on the air on CW, worldwide. I would expect a generation would have to die out, plus a lot of the new folks for it to finally pass on. That, in my estimation, will be around the year 2025 or so, unless unpredictable things happen. So, that gives another 25 years or so of life to add to 150 past. I would expect that by then it will become a lost art and craft, like shoeing horses (but that still manages to survive a little).

> Do a 100 year time line of the number of services using Morse
> code over the years. You will find an ever-decreasing amount
> of usage because it is flawed for everything except fun. Fun
> can be afforded only by the ARS.

Mostly true. But, it still manages to survive rather well.
The amateur radio service is not supposed to be for fun.
It is fun, but that is not its basis. As to its fun aspects, Morse is sort of like learning another language, or playing the fiddle, or doing anything else that gives one a bit of pride in an art and craft. Even though it may be passe and politically incorrect, learning an art and craft these days, it will be there for a long time to come. As to its testing requirements, which is where most of the CW debate hinges, I would suggest that after the commercial requirements go belly-up (sometime after the GMDSS comes on-line and settles down into something working) officially on February 01, 1999, plus some settling time of maybe a year or two, that testing requirements beyond the minimal entry level skill of 5wpm are not required, and exams can be ammended for such. Then, it all becomes a historical footnote. But, it won't die out on the ham bands, not for a long, long time. It will be there, if

you take the time to listen, know what to listen for, and how to listen for it.

The novice bands provide a lot of other activity besides 10M fone. Anyway, you can't work CW, RTTY, SSTV, etc on CB, nor may you run 100 or more watts output power. The operator is spoonfed his operating freqs on CB, with pre-set channels. 15 meters is an excellent band, and though the Novice portion of 40 sucks at times because of the broadcasters in ITU region 1, 80 is OK. While I agree that contesting is pretty boring, there are those who enjoy it, and there is none on 11. Technically, DX on 11 meters is illegal. I guess compared to Nov/Tech priveleges, CB really isn't so free after all.

-

Sorry, Jeremy,,, there have not been any First Class Radiotelephone tickets issues in many many years. You will have to settle for a General. The question pool is published and available both from the Government Printing Office and from several private sector distributors. W5YI Group is one. I believe they are in Dallas, TX. The question pool was, at least when the pool was first published, mostly lifted from the Advanced and Extra class written exam elements. If you have recently sat for both of those tickets, you can bone up for the Gen Fone in a couple of days. The only thing different will be that there will be material on part 80 rather than part 97.

When the FCC did away with 1st Phone, they grandfathered all 1st fone renewals down to General. Really upset some OMs.

The FCC no longer gives the exam. You will have to go to a COLEM, and the package you get from W5YI will list them all.

Commercial tickets are not free. I think it is about $35 now for an original Gen Phone. The COLEM will charge you about $70 to give you the test, whether you pass or not, so don't go in on a whim. Study first.

If you have your Extra, see if you can still use it as credit for the 20WPM code requirement for 2nd Class Radiotelegraph. May as well go for the gold. 2nd RT supersedes Gen Phone, though you may have both licenses if you like. They will not cancel your Gen just because you get your RT. The multiple choice format for the ham code test is a little easier than the regular commercial ticket exam, which you can only pass with a minute of perfect copy out of 5 minutes of code sent. They were doing this when privatization was just getting off the ground because the COLEMS knew jack about administering a 20 WPM Morse exam. This hole might be plugged up by now.

The elements for Gen Phone are elements 1 and 3. I think Ship's radar is el.6, 4 is for 3rd RT, 2nd RT must take 1, 3, 4, and 5, GMDSS Operator is 7, and Maintainer is 8. There is no written exam for 1st RT, only service requirement, USCG license, and a 25 WPM code est. !st alone will get you a Marine Radiotelephone Operator Permit.

Schooling? You don't need it to get the license; just study the Amateur Advanced and Extra study guides and the question pools for the commercial ticket. You should pass no sweat. Acquiring the knowledge and skill you need for employment is a different matter. There are a lot of correspondence courses you could look into, or you could just learn on the fly. The license doesn't really mean you know much. With the multiple choice exam format, it just means you can study and pass a test, and it is something the Feds can yank if you do something naughty, and so is a guarantee of sorts of your good behavior.

>
>That is EXACTLY what it is ... nothing more, nothing less ...

Its only an "initiation" or "hazing" to those unable to pass it. Which,
after 25 years as a coded tech, its pretty clear you're not able to.

Mike, please list the goals of the "coded" amateurs of the same period.
Now please provide a listing of accomplishments for said period.
Using goal achievement as a measure of success of amateur radio service
just might provide the justification to close the service.

Well said Todd

I am all in favour of code but only if people want to use it. I am learning code at present and finding it hard but intend to use it when I've passed.
Maybe we need two ways of getting onto HF, either CW or a higher class exam, whatever is decided something must be done soon because without the new blood we are doomed. So we must attract the youngsters and stop arguing amongst ourselves as lack of new hams will kill amateur radio far quicker than forcing them to learn CW.

We have the same problems here in the UK but only in the cities etc.

I live in Portland on the south coast and we have no such problems here, as it is an area with a fairly small population of CBers (100 or so) then everyone knows each other and we police it ourselves. We are mostly all interested in DX and when the skip is running everyone seems to congregate on the hilltops. The cities on the other hand are as you describe and not worth turning the radio on. We have a lot of hams locally of which I am one but we still use the CB as much if not more than the amateur bands.

Rambo is 75m the only band you ever listen to? their are 8 other HF bands which exibit none of the 'phenomenon' you describe above. I guess if 75m went away you wouldn't have much of an argument left.

of the future survival of ham radio itself.

> nor is this "gratitude" directed toward
> newcomers, as you call it.

The hell it's not ... by and large, the same Morseodists are also
VERY anti-no-code-tech ... calling them "lazy" "CBers" etc.

> Reading between the lines, one senses a lot of
> hostility in your posts.

Many advocates of progress have developed a degree of hostility
towards the forces of stagnation and decay as a result of years
of frustration with their backwardness and having suffered their
never-ending elitist/holier-than-thou discrimination and derision.

> The requirements for Morse proficiency are Federal law,

They are administrative rules, subject to modernization and change,
were it not for the efforts of Luddite groups like ARRL/FISTS.

> which is coordinated with international laws.

The ITU treaty does not specify ANY speed test requirement ... 5wpm
or even 5 words per week would COMPLETELY satisfy any treaty obligations.

> You make it sound like code is an initiation into a secret faternity.

That is EXACTLY what it is ... nothing more, nothing less ... the
ARRL/FISTS/Morseodist Luddites have insisted on the maintenance of
the Morse hazing ritual as a rite of initiation into their "fraternity"
in order to limit entrance into "their playground" (the HF bands).
This is an abuse of Federal regulatory authority to support the desires
of a minority special interest group at the expense of the public interest
goals set forth for the ARS in Part 97.1.

> If you are not happy with the laws as written, redirect your
> energy from newsgroup postings, to letters to legislative personnel--where it
> would do far more good.

Many of us (most licensed US hams, IMHO ... note that the ARRL is a DISTINCT minority, NOT the "representative" group it claims to be) are NOT happy with the rules as written and seek to change them. However, it is necessary to continue the debate in forums such as usenet in order to build the consensus and momentum necessary to burst the illusionary bubble of "representation of the masses of US hams" that the ARRL has managed to maintain despite the facts to the contrary.

Jeff KH2PZ

Interesting idea, and one with precedent. WLO uses a curious "di-di-dah-dah" character for cairrage return in their 31 WPM automated CW broadcasts. Some terminal programs already recognize it. In fact, the only reason I figured out what it was is my PK-232 and Pakratt II don't know what to do with it and so do not do a CR, while HAMCOMM does not print it but does the CR.

There is no reason why Morse Code cannot evolve. The only important thing is to keep it ear-copiable and hand-sendable. If it becomes too unwieldy to use without a terminal, all we will have done is created an inferior RTTY. The main selling point for Morse is it is usable with ear and key, keeping equipment requirements simple.

Good luck! The HTX-202 might be a big. clunky old radio, but it's fairly
rugged. You'll look long and far, I think, before you find one with blown
finals, even though Radio Shack has sold a dodecazillion of them.

Mike, there is a single band antenna,called (incorrectly?) an end-fed dipole. Measure back 1/4 wave from the bitter end of your coax, and make a choke by coiling a bunch of your coax in about a 10" diameter coil. usually 8 to 15 turns will do it. To the center conductor at the bitter end, solder 1/4 wave of wire. That's all there is to it. This antenna could probably be made to work pretty well, but I instinctively doubt that it would be as good as a good centerfed inverted vee. There is a lot of room for optimization of the coil figures in my admittedly vague description.

The classic Zepp, so named because it was commonly used on zeppelins, is just 1/4 wave of open wire ladderline end feeding a 1/2 wave wire. One conductor only is connected to the 1/2 wave radiator. The other connects to... NOTHING! it looks ridiculous at first glance, but it actually works. It was a practical expedient for airships because they could easily trail their antenna underneath. Don't confuse this antenna with it's far moe efficient cousin, the Extended Double Zepp. The EDZ is basically a dipole with the elements .64 wave long, and the ladder line feeder .145 wave long. divide the freq in MHz into 630 for element length and 135 for feeder length. Assuming 450 ohm ladder line, use a 1:1 balun to match the feeder to coax of any length needed to reach your rig. This antenna has some gain over a regular 1/2 wave coax fed dipole. The regular Zepp is not as good as a dipole.

Don't dismiss that "cheesy" dipole. A well designed dipole is a pretty decent performer for such a simple antenna. I prefer an inverted vee conffiguration,

since at resonance it more closely approaches 50 ohms. This allows me to use a SWR meter to trim the antenna to resonance much more accurately than the same method used for a regular flat dipole. I slope my ends down about 20 degrees below horizontal. Ideally, the coax comes off the antenna at a right angle for at least 1/4 wave.

Currently, due to mounting and supporting limitations, I am using an end fed antenna... 100 feet of wire with a tuner. I do get some radiation in the shack, but nothing I can't deal with. My TV is only about 10 or 12 feet away from the antenna feedpoint, but TVI isn't bad. My computer is about 5 feet away, and I only have to turn it off to work a station waaaaay down in the noise. I would try an end fed dipole, but the random wire gives fair multi-band performance and the end fed dipole does not.

It really amusing how the cbers will point to a few frequencies on the
ham bands to claim that ham radio sounds as bad or worse than cb, but
you can tune to ANY cb channel and hear all the garbage.

2187. a question concerning the dx-60 transmitter

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-24 00:00:00 UTC
From: lar01@sprynet.com
Message-ID: <34ca656d.34539028@news.sprynet.com>
Source record: 180705

greetings

During the first 3 or 4 years of my amateur licence, I used the dx-60. From there I went to the hw-100, etc.

Recently I found the meter from my old dx-60. I has two scaled ranges, one for grid and one for plate current.

While I was using the transmitter, I often looked at the schematic and marvelled at how all the circuitry came together to make a working transmitter.. I remember seeing the parallel resistor they used to increase the current range on this meter and give the plate current range.

At present, I would like to use the meter plate current range in a more modern project but, so far, I can't find the dx-60 manual.

Does anyone have the manual and can tell me what the parallel resistor resistance value was/is. If they used two reistors, one for plate and one from grid, would you let me know what each one was?
Thanks Larry ve3fxq

>of modulation, antenna proximities, receiver intercept points... not
>"well, golly, I turned on my laptop and the artificial horizon did a
>flip-flop!"

An incident report, and there are thousands on file, is enough evidence
to take prudent action. In many cases, a suitably strong correlation has
been established by turning on and off the consumer electronics in the
cabin. The possible interactions among the universe of consumer equipment
which might be operated aboard an airliner are simply so large that no thorough
controlled test is possible which would reliably say that you can use consumer
item A on board but not consumer item B. Either alone might be fine, but the
presence of item C on board could confound that. If you've ever attempted to
do IMD calculations for a site with many emitters, you know that the problem
very quickly becomes too large to model effectively.

>Still another point of view is that if such an instance of interference
>to a safety-critical system has, in fact, occurred, then there is an
>issue of criminal negligence on the part of the FAA for permitting such
>poorly-designed avionics equipment and archaic modulation modes to be
>used on board passenger aircraft in the first place.

Installed base. There's no way the airways systems are going to change
over worldwide at the same time, and that is exactly what would be required
if a different modulation type were to be adopted. AM has certain advantages
for aircraft communications and navigation which would be cumbersone
to duplicate with other systems. It has certain drawbacks as well, but the
logistics of making a switch are so daunting that it isn't going to happen
when the problem can be avoided by restricting consumer emitters on
board the aircraft.

>Another way of expressing the latter point of view: if some kid with a
>Game Boy in aisle 25 can bring down the plane by booting up Mario at the
>wrong moment, I think I'll take Amtrak, thank you very much.

Then you can deal with bad track and idiots racing the train to a crossing.
It is much easier to police passenger use of consumer electronics than it
is to regulate the interaction of millions of drivers with the railway system.

>Beyond that, are you somehow privy to aspects of the KAL007 incident of
>which the rest of the world is unaware? I'd be interested in hearing
>more about the "source of tragedy" you mention.

We'll never know exactly why they went off course, but the belief is that
they made an erroneous entry into their on board inertial platform before
takeoff. What happened to KAL007 illustrates how a minor course error
can have fatal consequences. That sort of course error, though usually
not with Soviet fighter intervention, could also occur due to interference
with radio navigation systems, and it *has*. There are many incident reports
confirming that.

>Really, Gary, this kind of groundless, anecdotal paranoia is beneath the
>usual high quality standard of your posts.

I am content to stand by the conclusions reached by the FAA and NTSB
about the hazards of uncontrolled operation of consumer devices on
aircraft. The only way to assure safety without restrictions on consumer
electronics is to perform a total EMC test on every aircraft with every
passenger load and passenger consumer device combination. That's
so obviously impractical and absurd, the only prudent course is to
simply ban use of the devices on board aircraft in flight.

Then you'd better stay on the ground, because they all can. Usually,
the consequences aren't fatal, but they can be and they have been.
Air carriers take a number of steps to reduce that risk. One is the
use of separate navigation systems which can be cross-checked
against each other. Another is to order passengers to refrain from
using consumer devices which haven't been certified as compatible
with flight avionics.

If I read this correctly, the meaning might more accurately be "All you no-code types stay off HF and leave it to the 'big boys'." Very collegial attitude. There is no reason an Amateur cannot access the HF bands as long as the necessary license is in hand. That said licenses currently require ridiculous code testing requirements which need to be removed is the whole point behind D.'s comments. Code testing requirements have no place in Amateur Radio license testing in this modern age. But, then again, some people need to be brought kicking and screaming into the present, don't they? =0)

>You still haven't shown how the ARS is being "strangled."

Open your eyes and ears: One need only view the comments of YD, MD, JH (look in the mirror), then listen to the HF bands, and one sees immediately how Amateur Radio is being strangled. IMO, the attitudes, words, actions (physical and verbal), and extreme resistance to changes that threaten/affect the useless traditions of the supposedly "elite" licensees of the Amateur Radio service do more to suffocate and depress Amateur Radio than anything else. What else do you need?

Are we sure young people won't enjoy code? I started at an age of 13 because code was fun. Maybe code should be advertised to the young as one of the "fun" aspects of the hobby.

Just a different twist to the saga.....

I take note that today is the 42 nd anniversary of my ham career. I started as KN0DON in 1956 and did so because I particularly enjoyed CW. My elmers, W0DSP and K0AVW, may they rest in peace, encouraged me to operate, any mode, any way. Just enjoy!

To date, of my 35879 QSO's, 19046 have been CW. I was 14 years old then and gess I just didn't know any better.

I have a Yaesu 101EX that has not been used for sixteen years (other than as a receiver for the past year). I just became a Tech Plus and tuned the rig per. the manual for 10m and can only get it to trans. at nine watts. I had a ham friend tune it on 80m and the output was 120 watts.

Can anyone give me some idea what may be the problem? Any info would be appreciated.

A new ARRL Director who has vowed to take hams who use indecent
language off the amateur bands says that he wants tape recordings of
alleged offenders sent directly to him. Joe Falcone, N8TI says that he
will use the recordings as proof to the FCC that the problem is
nationwide in scope.

Specifically, N8TI is looking for good quality off-air cassette
tape
recordings that clearly demonstrate that a violation has taken place.
The
audio quality must be good enough so that anyone hearing the tape will
recognize the language being used without the need to replay it a
second
or third time. This means using a direct connection to your
transceiver
or receiver.

2210. Rain Dial-Up for Jan 23-29, 1998

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-24 00:00:00 UTC
From: arnoldr@ollie.ralabs.com
Message-ID: <34c8a865.1548112@news.axess.net>
Source record: 180786

This is being posted at the request of Hap KC9RP who does not currently have usenet news access. Please direct your questions about RAIN to Hap at

hholly@nospam.ollie.ralabs.com

(Note: delete the "nospam." in the above address for the actual mailing address)

The RAIN Dialup for Jan. 23-29, 1998 includes:

"Phase 3D, A Refresher", an excerpt from the 1997 Dayton Hamvention Amsat forum talk by Ed Krome/K9EK, Southern Indiana Amsat Coordinator (7 minutes, 41 seconds).

"Telex Hygain's Test Range", a short excerpt from a Hap Holly/KC9RP interview with Telex-Hygain senior antena engineer Roger Cox/WB0DGF, talking about Hygain's indoor/outdoor testing range (4 minutes).

For those reading about the RAIN Dialup for the first time, no one connected with it receives compensation from or for it. RAIN (Radio Amateur Information Network) receives no commercial funding. All revenues derived from non tax exempt donations and subscriptions to our 2 audiocassette publications help to defray production/maintenance costs and telephone charges. If you can help toward that end, our mailing address is RAIN, PO Box 2565, Des Plaines, IL 60017-2565.

The RAIN Dialup updates Fridays on the worldwide web at

http://rrsta.com/rain

you'll need at least a 28.8 modem to listen to our Real Audio 3.0 streamming audio there; you can dial up this program until next Thursday evening at area code 847-827-RAIN. The RAIN Dialup is copyrighted 1998, all rights reserved. Audio Internet distribution of this service is only licensed to Bohnhoff Mediacasting at RRSTA.COM; on H.F. to WA0RCR, Wentzville, MO; and on satelite to This Week in Amateur Radio; unrestricted local VHF/UHF over the air dissemination of this weekly program is encouraged.

>Looking for anyone who could direct me to the write page for
>construction plans on a 2 meter 300 ohm ladder line antenna.

What you are seeking will be in antenna manuals, indexed as a "Folded Dipole". On 2 meters, I make mine from high quality TV ribbon, because it has more physical strength than ladder line.

The advantages are many. The most noticable will be the low losses in the feed line. You will be able to see an improvement on both transmit and receive. I mount mine vertically, secured to a wooden pole. Bring the feed line out at right angles to the antenna for at least 1/4 wavelength.

Converting the output of your radio to 300 ohm line is so simple, it will make you wonder why anyone uses coax at these frequencies. See the manuals for "coaxial baluum".

Hi, Marc. Interesting bit of history, but that was many years ago. I have never heard SSB on Ch. 16, but it could be happening, somewhere I suppose. I would prefer to be on the upper channels of the present band, where all the SSB action is.

I stand by my original advice to Bill, which is reprinted below (and which acknowledged that one MIGHT hear SSB on Ch. 1-23).

Yrac's Opinion:

Hams are not "insisting" on anything, nor is this "gratitude" directed toward newcomers, as you call it. Reading between the lines, one senses a lot of hostility in your posts. Only you can choose whether this will be channelled for a good cause.

The requirements for Morse proficiency are Federal law, which is coordinated with international laws. You make it sound like code is an initiation into a secret faternity. If you are not happy with the laws as written, redirect your energy from newsgroup postings, to letters to legislative personnel--where it would do far more good.

The is a best half right. The Relavent treaty states nothing about the
speed of Morse Required, the text of the Treaty as currently writtied
would met by a 1 letter per minute. The FCC part 97 is part of the
regulations cr3eated by the FCC to follow the Comunicattions act of
1934, as ammended. I have not read that law, but do not think it has
any morse requirements, in it at all for ARS. The FCC is record as
wishing to maintain the Morse requirement because the the ARRL wishes
its. The treaty itself is reviewed regularly, recents moves to remove
the morse provisions have been opposed by the US , allegedly because we
the ARS operator say we want it retained. Therefore the only the Morse
can be dealt with is to convince our fellow amatuers that Morse

REQUIREMENTS, which isn't the the same as morse use, should be consigned to history.

All in all the idea that Morse is maintained by law, noit because some hams wish it, is as big a lie as Hilter's claims that the WW2 started because Poland attacked Germany.

>no-code types stay off HF and leave it to the 'big boys'."

It only reads that way if you're a charter member of the No-Code Agenda looking for more conspiracy theories than Mel Gibson.

The plain fact of the matter was that in the mid 1980's the codeless tech license was sold to amateur radio on this premise: it would bring hoardes of technical geniuses into our hobby who would flood the VHF+ bands, saving them from reallocation, while at the same time (because they are geniuses) would lead the charge in technical innovation and bring amateur radio into the 21st century.

Its all there in black-and-white. Go back and read some of the editorial comments and letters-to-the-editor from different magazines of that era.

Fast forward a decade, and now, when the codeless tech license has been an abject failure with its goals (yes, it has brought a lot of people into ham radio, but it hasn't fulfilled any of the goals it as promised to) we have the No-Code Agenda pushing for a codeless HF license.

Back in the 80's, there was a lot of skepticism regarding the codeless VHF license, and most of those who opposed it did so because they realized two things: 1) it was a dead-end license for people -- once licensed, they have nowhere to go; 2) Shortly thereafter, they knew the No-Coders would be back demanding Codeless HF access.

The No-Code Agenda is very insidious, and similar to that used by other radical groups like Handgun Control, Inc. The goal of this latter is to ban all guns -- but, they know such an idea is too radical, and would never be supported, so instead they take the "baby steps" approach -- ban a few guns at a time, and before you know it -- whooosh! All guns are banned.

The No-Code Agenda has adopted a similar, albeit shortened, strategy. First they went after VHF, and once they got that, they turned their heads to HF. Never mind that all the promises of the codeless VHF license were a bunch of bunk.

The codeless license was supposed to be a panacea for VHF operation.
The vast majority of technical experimentation -- high data rate thruput,
spread spectrum voice, etc. -- all require large amounts of bandwidth which
exist on VHF and *not* on HF.

If "technical experimentation" is your goal, then VHF is your destination.
And, we *already* have a license, without any code requirement, to let you
get on there in as little as 5 to 7 days (take the test on Monday, and you
can virtually have your license via the Internet in 5 days) and start
experimenting. All this, mind you, with a theory exam that is predominently
rules/regs, has very little electronics theory, yet gives you the capacity to
fry your own brain. How much easier can it get? How much easier do you want
it?

On the other hand, there is very little technical experimentation which
occurs on HF (sure, some will try and concoct some ludicrous story to
cover their real motives, but even if you accept their story as true, they
[the HF experimenters] are in a vast minority compared to the type of
technical experimentation that would/should occur on the VHF bands.)
The *ONLY* rationale for a codeless HF license is to quickly and easily
give people access to HF phone, so they can get on the radio and start
calling SSSSSEEEEEEEAAAAA-CCCCCCCUUUUUUEEEEEEE DDDDDEEEEEEEEE-XXXXXXX!

The No-Code Agenda is a lie, just as it was in the mid 80's. And, its our
duty to stop it.

> Open your eyes and ears: One need only view the comments of YD, MD, JH (look
>in the mirror), then listen to the HF bands, and one sees immediately how
>Amateur Radio is being strangled.

My logbook is loaded with contacts. Whenever I get on the radio (which I
admit is less than I would like) I have zero difficulty finding someone to
converse with.

>IMO, the attitudes, words, actions (physical and verbal)

The *ONLY* person on these newsgroups who has *ever* suggested a physical
act against another ham is Spew Durigan, aka CB Bimbo, who openly
encourages people to pin other people's coax and rip down their antennas when
you disagree with them. (of course, he also calls all mexicans lazy, and
says that aids is god's revenge on gays, so you can judge for yourself the
kind of kook he is...)

>and extreme resistance to changes that threaten/affect the useless
>traditions of the supposedly "elite" licensees of the Amateur Radio service do
>more to suffocate and depress Amateur Radio than anything else. What else do
>you need?

There is no resistance to change in amateur radio. Amateur radio is many
things to many people. Some like EME, some like CW. However, we are a
nation of laws. Amateur radio has a series of regulations to follow, and
some of those deal with licensing requirements. Fulfill the requirements
and get a license. Its that easy.

I'm so pissed I could shit!

There is a new (and apparently "legal") way to steal
from you. You've probably gotten a phone call from
a telemarketer who represents one of your credit card
companies. I usually hang up. But they have a new
way to sell this crap to you, and it's VERY sneaky!

Today I received a mailing from Citibank Visa. It's
your typical junk mail, trying to sell me a member-
ship to some travel service called "Citibank Travel".
Like most of my junk mail, I throw it in the trash.
Five minutes later, I remember an incident that
happened last summer when I threw away some junk
mail and got the damn service anyway.

Here's what they do. They automatically charge your
account WITHOUT YOUR PERMISSION! The way you stop
them from doing this is to call a toll free number
telling them NO. But this number is ALWAYS busy!
(This is to assure that you do not cancel the
membership.)

This practice is nothing but stealing! I've tried
to contact my Congressman about it, but they are
afraid to go up against the big banks like Citibank,
Superior, MBNA, etc. and challenge this rude and
obnoxious practice.

My question: Is there a lawyer in the house? What
can the average consumer do about this practice?
I know you can issue a "charge-back" to these jerks,
but that's after the fact that they've raided your
account. What recourse do we have????

>

You mean most experienced ham operators, or more experienced CB operators? If CB, what do you mean by more "capable" equipment? Sorry, 4 watts AM or 12 W SSB are the legal limits. You must use fixed channel tuning, and transmissions must be clear speech. You may not work DX. I forget what the limit is, and I don't have the applicable part of 47 CFR handy, but there is a limit on how distant a station you may have two-way communications with. That's the way it is. Anything above and beyond that is illegal, and subject to cause interference to legitimate, law-abiding ops on that band. Not only is using bootleg gear illegal, it is inconsiderate to other CBers, and to TV watchers. CB rigs are notorious for transmitting harmonics that cause TVI, and converted ham rigs are almost as bad since the output filtering is not optimized for 11 meters. I can run 100 watts into an end fed wire 10 feet from my TV on 20 meters and never a flicker. The AM CB guys I can actually copy with my TV when they drive by. That is rude, because they know they can cause such interference, but most seem not to be concerned about it. Sticking to the legal output power helps keep the TVI down to a reasonable level.

I respect a considerate, technically competent, law-abiding CBer just as much as his ham equivelant. A bootleg CBer however is no different than a bootlegger on any other band.

When you hear the tone frequency go down, down, down to the point of
inaudibility. Essentially, the signal that you have zero-beat will deliver
received audio with a frequency of zero Hz, and so you will no longer hear
anything.

_/ _/_/ _/_/ _/ _/ _/ _/ _/
_/ _/ _/ _/_/_/ _/ _/ _/ _/
-
Here is a summary of news items covered on edition #252 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 30-Jan:
-
1. ARRL Board Holds Meeting -- Pushes Enforcement, DXCC Changes
2. 1997 ARRL Humanitarian Award Presented
3. New Owner for Amateur Electronic Supply -- Business as Usual
4. Endeavour Launched from Florida, Eighth US Mission to Mir
5. Special Event Station Calendar
6. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
7. New CBC Service Debuts Early Due to Severe Storm
8. Ham Radio TV Show Airs on New York City Cable System
9. "Ancient Amateur Archives" with Bill Continelli, W2XOY
10. "The RAIN Dial-up" from Chicago
11. Weekly Propagation Forecast
12. AMSAT Members Push for '50s Stamp in New USPS Century Series
-
Funding for the program's transmission and production expense was
provided this week by a grant from Gene Wicklund, W0ZOK, of
Horace, North Dakota, where "This Week in Amateur Radio" is heard
via satellite Saturdays at 8:00 PM along the Red River Valley on
the W0ZOK repeater on 443.75 MHz.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The
program is heard on the "W0KIE Satellite Network" each Saturday
at 9:00 PM (EST) on the Hughes Communications SBS-6 commercial
communications satellite, transponder 13B upper, located at 74
degrees west longitude in equatorial geosynchronous orbit. The
transponder center frequency is 12.019 GHz; tune up in frequency
to 12.031 GHz. Program audio is on the 6.2 MHz analog
subcarrier. A fee has been paid to W0KIE for access to the
satellite uplink.
-
On the WorldWide Web, program audio can now be found in several
formats (including streaming audio) at http://www.roava.net/twiar
through the courtesy of the Blue Ridge Video and Digital Society
```

of Roanoke, VA, and at http://user.icx.net/~ke4hsm/twiar.html with thanks to Greg Williams, KE4HSM, of Knoxville, TN. The service is carried on VHF/UHF repeaters throughout North America and by WA0RCR on 160 meters at 1860 kHz.
-
Here in the Capital District, "This Week in Amateur Radio" is heard on our "flagship" repeater, WA2OQE/R in Troy, on 145.33 MHz, courtesy of the Niagara-Mohawk Amateur Radio Club. The program is repeated Mondays at 8:00 PM.
-
Production and transmission expenses are underwritten by donations from repeater operators, amateur radio clubs, and individuals. Further information is available from George Bowen, W2XBS, at 518.283.3665 (packet @ WA2UMX.FN32AW.NY.USA.NA or email kxkvi@delphi.com) or Stephan Anderman, K2SMA, at 518.664.6809 (packet @ N2TY.FN32DW.NY.USA.NA or email sanderman@delphi.com).

> guns at a time, and before you know it -- whooosh! All guns are banned.

Nobody is trying to ban Morse code like they are trying to ban guns. There is zero proof of any similarity between the two movements. If anything is true, the pro-code-test folk are similar to the gun control folk, both groups favor governmental regulations to solve perceived problems.

Gun control is similar to *maintaining* the code testing requirement. Both are governmental regulations that should not exist. Gun control folk want more regulations. No-code-test folk want fewer regulations. The no-code-test folk want freedom from outdated governmental regulations. The gun control folk want to violate our freedoms with more regulations. THE NO-CODE-TEST FOLK ARE THE EXACT OPPOSITE OF THE GUN CONTROL FOLK. It is the pro-code-test group who favors governmental power and maintaining outdated governmental regulations and therefore are akin to the gun control folk.

Using exactly the same logic for guns that you use for HF ham radio, only a select few citizens should be allowed to own guns. Gun ownership is not for everybody. Only 0.2% of US citizens should be allowed to own guns. Individuals who cannot achieve expert status and meet the gun testing requirements should find another way to defend themselves. Sound familiar?

> The No-Code Agenda is a lie, just as it was in the mid 80's. And, its our
> duty to stop it.

Saying that there is a "No-Code Agenda" is a lie. There is a no-code-test agenda that isn't a lie at all. The no-code-test agenda exists for the single purpose of lowering or eliminating the code testing requirement thus decreasing federal governmental control over the lives of the alleged free citizens of this alleged free nation. And that's the truth.

2232. The No-Code VHF license - a success

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-24 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <6adfevmmm1@w3eax.umd.edu>
Source record: 180808

It MAY have been proposed as a way of getting techno-whizzes
who just didn't want to learn the code into the amateur service.

What has actually happened?

Those techno-whizzes still find themselves, by and large, not
interested in ham radio. If they WERE techno-whizzes, they
probably could have picked up the code, at least 5 wpm, pretty
quickly. But they didn't, and by and large, even a pair of
written exams didn't interest them.

HOWEVER

1) The no-code license served to create a LARGE number of hams
who were ready, willing, and able to do public service and keep
the light turned on on repeaters nationwide.

2) It used to be that "entry level hams" could operate HF CW,
and meet one new person at a time. It was slow, and ideas
hard to exchange. Only AFTER picking up the code were people
able to actually talk locally to other hams via VHF+ FM.

WHAT HAS HAPPENED? It's REALLY quite amazing!

What I have seen in the DC area is a reverse-genesis, of
sorts. There are many VHF hams, and they talk to General,
Advanced, and Extra class hams.

What do they talk about? Antennas, operating, even ways
to learn code. They discuss with each other how they're
progressing with the code and the theory, when they're
going to put up a 40 dipole or loop. They do code practice
sessions via MCW, either via repeater or simplex.

It's really quite amazing; the no-code tech license has
effectively created, much as the internet has, the "long
or at least not just across the street-distance" elmer
and peer group that I wish I had had when I was a Novice
back in 1984.

Although I had elmers, I felt very much alone in learning
how to be a ham. Today's Technician licensee, through the
existence of the No-code license, has created a sense of
community that I think is a very, very, very goof thing
for these licensees to have!

(and they're making a lot of it, too!)

> The no-code licences have saved amateur radio in the u.s. from oblivion.

Err, no. Sorry. Amateur radio was alive and well prior to the codeless tech license. It would be alive and well without the codeless tech license. The codeless tech license did little for amateur radio except create a "family radio service" weigh-station within our bands.

[another post about code requirements deleted]

> The is a best half right. The Relavent treaty states nothing about the
>speed of Morse Required,

Correct.

>the text of the Treaty as currently writtied
>would met by a 1 letter per minute.

I doubt it. The treaty states that one has to show "proficiency" in sending my hand and receiving by ear. 1LPM is arguably not "proficient". Some say that 5wpm isn't proficient either.

> The FCC is record as
>wishing to maintain the Morse requirement because the the ARRL wishes
>its.

Err, no, the FCC has stated that as long as there is "no consensus" within amateur radio to eliminate the code requirement, the code requirement will remain. The Code requirement has nothing to do with the ARRL.

>The treaty itself is reviewed regularly, recents moves to remove
>the morse provisions have been opposed by the US , allegedly because we

yeah. it's got the "witch hunt" smell on it. in this age of forgery, i would think it possible to create "evidence" to make a case.

not everything that plays on commercial broadcast may be suitable for use in a two-way radio service. i believe the courts would agree.

Hello all,
My son (KF6JQR) aquired a swan 500 from the family of a recently deceased Ham.
Unfortunatly, there is no manual with the radio and we are not sure
how to tune it up.

Can anyone provide a brief run down of the procedure or point me to
a place where we can obtain a manual?

Thanks,
Dave
N6YVC.

Source record: 180824

>
> All in all the idea that Morse is maintained by law, noit because some
>hams wish it, is as big a lie as Hilter's claims that the WW2 started
>because Poland attacked Germany.
>
>Mark Morgan

Yrac responds:

97.503 Element Standards
(a) a telegraphy examination must be sufficient to prove that the examinee has the ability to send correctly by hand and to receive correctly by ear texts in the international Morse code at not less than the prescribed speed, using all the letters of the alphabet, numerals 0-9, period, comma, question mark, slant mark and prosigns AR, BT and SK.*

*For sending test requirements, see 97.509(d).

I stand by my original post. (1) The Code requirement is presently is required because of the law. (2) If someone feels strongly about the Morse code requirements as they pertain to Amateur radio, it will do much more good to spend time and words directed toward those who can make a difference, rather than writing long, repetitive articles on the newsgroup.

If you'd actually taken to the time to determine which article was
cancelled, you'd discover that this cancellation is a whole lot
more understandable than you want to make it.

You neglected to include the subject header of the cancellation post:
Subject: cmsg cancel <34c49ca1.1107915@news.total.net>
The part in the brackets is the message ID from the cancelled message.
All you have to do is go through all those posts of yours and see which
one carries that message ID.

Anyone can do this, using
http://www.dejanews.com
If you searched in rec.radio.amateur.misc for messages with your latest
email address, say going back from January 20th through to a few days
previous to that, you'd see all thos way too numerous posts of yours.
Click on each of them, and check the message ID of each one until you get
a match with the message ID referenced in the cancel post.

And you'd find that the original post was cancelled for good reasons.
Remember this one?

Subject: Re: $$$IMPORTANT$$$
From: cute@radiotelephone.net.ham (Cutie Boy)
Date: 1998/01/20
Message-ID: <34c49ca1.1107915@news.total.net>
Newsgroups:
rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur

You quoted a good portion of a Make Money Fast post.

The way to deal with those is to ignore them, or do as I almost suggested when I saw that useless post of yours, forward the MMF message to the postmaster or abuse at the site where it was posted from, which is a whole lot more constructive than making comments about it in the newsgroup.

Nobody sinister cancelled this message of yours. It actually said int he body of the cancel message
"Automatic cancel message requested by WorldNet."

Somebody would appear to have a conscience, and is cancelling MMF posts automatically. You made the error of responding to a MMF post in the newsgroup, so it got cancelled along with similar messages.

As for who cancelled, it's there in the message ID header of the cancel post

6a2u56$ao7@anchor.cis.att.com

Somebody at that site is issuing cancel messages. If you look at all the headers in the cancel post, probably there is more information about who sent it out. I haven't kept track of it, but probably this is a well known site that automatically cancels MMF's. Probably you can find a post somewhere that announces the cancelation of a batch of MMF posts.

This is the only cancel message for you in the past week or so, according to dejanews. Again, you can do a search with your email address (of course, you'd have to check for all those previous email addresses you've used too) and look for subject headers that start with "CSMG"

While there are plenty of reasons for people to want to cancel your posts, one could just start with the regular cross-posting, nobody is doing it on a regular basis. You just posted a message that was worthy of a cancellation post according to a fairly reasonable agreement on what is acceptable to post. If you don't like spam, and if you don't like Make Money Fast posts, then you have to make a point of not contributing to the problem.

2250. FS: Collector's Vintage Tube Reel to Reel Portable

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-24 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <6adue0$s6i$5@csu-b.csuohio.edu>
Source record: 180826

A CLASSIC COLLECTABLE VINTAGE AMPRO REEL TO REEL RECORDER

AMPRO CORP MODEL 758 TWO SPEED HI-FI REEL TO REEL TAPE
RECORDER -- MID 1950'S IN NICE PHYSICAL SHAPE
ORDER, but will need apparently minor adjustments & lube.

- GREAT 1950'S ERA BEAUTIFUL STYLING & DESIGN WITH:

* COCOA BROWN CONTROL PANEL & GRAY KNOBS/BUTTON AND RAISED
GOLD AMPRO LOGO.
* MATCHING COCOA BROWN CARRYING HANDLE AND AMPRO LOGO
COVER LATCH
* HAS GRAY SHARKSKIN CASE WITH FULL-FRONT BASKET WEAVE
SPEAKER GRILL. Just a great looking unit if you're a
1950's buff & love that styling.

- GREAT UNIT FOR REEL TO REEL COLLECTORS OR FOR SOMEONE
WHO JUST WANTS A GOOD OLD FASHIONED HIGH QUALITY MONO
UNIT.

- Ampro made high quality tape recorders in their time and
seeing this unit is an example of it.

The interior panel is like new and the case is very good with a
few scratches on the bottom and some minor dings, etc, but very
minor for a unit of this age. We're talking about 40+ yrs!

- SIZE (APPROX.)

16 5/8" WIDE x 10 5/8" HIGH x 16 1/4" DEEP

- WEIGHT (APPROX.)

38 pounds (fan cooled) TUBE POWERED

CONTROLS:

- Dual 3 3/4 & 7 1/2 IPS tape playing speeds.

- Green Eye Tube Recording Level Indicator

- OFF/Volume Knob

- Treble/Bass Knob

- Buttons
* Record & Lock
* Forward
* Rewind

* Play
* Stop

INPUT JACKS

- Radio/Phono

- Microphone

OUTPUT JACKS

- External Amp or Speaker

- Remote Control On/Off Switch & Plug

Handles 7 inch reels.

- Unit does not come with microphone

Unit needs attention--The playback is sluggish at either speed, thus slurring the words, etc. This will require attention. Have a copy of the SAMS PHOTOFACTS repair manual for it, I will throw in for someone who can do the necessary maintenance/repair.

$75 plus U.S. Parcel Post Insured shipping cost, which isn't much. I'll pack it free.

I can email a color photos of the unit for your review, if you wish in the .jpg file format.

Thank you.

I agree, Wayne, and it would be a lot more fun if it were not stuffed down their throats by a bunch of megalomaniacs, i.e. "don't let the door hit you on the way out." I learned Morse code at the ripe old age of ten years so I could secretely communicate with my cousin next door. It was fun. Nobody forced me to do it. I still enjoy it.

CB Bimbo, aka Spew Durigan, has a bad case of "ticket envy". He can't
transmit on 75 meters or 20 meters, so he tape records a dozen or so
idiots up there and parades them around as "examples" of how he shouldn't
have to take a code test.

>Nobody is trying to ban Morse code like they are trying to ban guns. There
>is zero proof of any similarity between the two movements.

Of course, if you call HCI and ask them if they want to "ban all guns",
they will reply "no". Sometimes it is necessary to "read between the lines",
because people do not readily reveal their intentions.

>Gun control is similar to *maintaining* the code testing requirement. Both
>are governmental regulations that should not exist.

I guess being "pro theory" means your akin to "gun control" too right? Or,
are only those examinations you happen to agree with "okay"?

>No-code-test folk want fewer regulations.

Pro-code folk want fewer regulations too. Pro-code folk also want those
regulations that exist to be adhered to.

>Using exactly the same logic for guns that you use for HF ham radio

Owning firearms is a constitutionally-guarenteed right. Operating an HF
radio is not.

>Saying that there is a "No-Code Agenda" is a lie. ... The no-code-test
>agenda exists ...

Gee Cecil, contridicting yourself in the same paragraph, eh?

I believe a more accurate FCC quote is that they do not remove the
morse requirement because "there is no consensus within the amateur
community" to eliminate it. That does not mean nor imply the ARRL.

>Why do you continue to make the mistake of using the
>totally inaccurate expression, "No-Code Agenda"?

As the person who invented the phrase "No-Code Agenda" (if you don't believe me, go look it up in the DejaNews archives), I believe it is my right to also create its definition. The No-Code Agenda is a catch-all phrase defining people who adhere to an anti-cw philosophy. Anti-CW might include people like yourself and Bill Sohl, who want to eliminate a code examination, and others like Carl Stevenson and Len Anderson, who want to ban the use of CW on amateur bands completely.

The term "No-Code Agenda" only conveys a "banning CW" message to those with guilty consciences.

>Why not use the accurate expression, "no-code-test agenda"?

Because that expression is not accurate.

>Isn't using the expression "No-Code Agenda" just as bad as the other side using
>the expression "Pro-Code Nazi"?

Absolutely not. I'm sure you recognize the definition of the term "agenda". That is very different from personalizing the definition and calling someone a "Nazi". "Pro-Code Nazi" would be akin to me using the term "No-Code Nazi".

>Both expressions are inaccurate and designed
>to elicit an emotional response instead of rational thought.

I do not believe the term "No-Code Agenda" elicits emotional responses, any more than calling it "No-Code-Test Agenda" would. An agenda is a plan, a set of goals to accomplish, a set of ideas to promote. While the term "No-Code-Test Agenda" might better describe people like Bill Sohl, it does not accurately describe all people who profess anti-CW views in this newsgroup.

>slowly going away.

Hi Fran,

Exactly what definition do you use to say "amateur radio is going away"?
There are more licensed amateurs today than in the history of the hobby.
Amateur radio has seen consistant growth in its licensed numbers since
its inception.

The idea that "amateur radio is going away" is nothing more than yet
another of the "10 Big Lies of the No-Code Agenda".

SB DX @ WW $OPDX.341
Ohio/Penn DX Bulletin No. 341

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 341
BID: $OPDX.341
January 26, 1998
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 440-237-8208 28.8k-1200 Baud 8/N/1 (New Area Code!)

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, WB2RAJ/WB2YQH & The 59(9) DXReport, K2WE, KA2AEV, WB2CJL, K3DI, K3ZO, W4WX, WA4JQS, N5PG, K8BK, N8BJQ, N0ZOH, AH0W/OH2LVG, G3VMW, G4BUE & DX News Sheet, G4BWP, HB9ABO, HB9CYN, JA1IST/DL6FDB, OH2BU/OH7RF and PA3GBQ for the following DX information.

3B7, ST. BRANDON. A large group of operators will activate this rare location from May 6-17th. Several stations will be on the air 24 hours a day on all bands operating on CW, SSB, RTTY and SSTV. Operators and participants are: 3B8CF, 4X1DF/A, HB9ABO, HB9ADP, HB9AFH, HB9AFI, HB9AHL, HB9AJW, HB9BQI, HB9BQW, HB9BXE, HB9JAI and K5KG. The organizators are the Union of Swiss Short Wave Amateurs (USKA), Section Zug, HB9RF; and Project initiator HB9JAI. They have a written confirmation by the Mauritian authorities saying that a radio licence for St. Brandon will be granted. To assure the necessary funds for their DXpedition, they are asking for help from the DX community. To help, contact Josef Meier, HB9AJW, E-mail address: 100450.540@compuserve.com. A dedicated Web site for the St. Brandon DXpedition is under construction. It should be operational by mid February, 1998. The link to this site can eventually be obtained from http://www.uska.ch (under "Links", "DXPedition").

3B9, RODRIGUEZ ISLAND. The "DX News Sheet" states that the Midway-Kure DX Foundation (MKDXF) is planning a spring DXpedition.

3C0, PAGALU ISLAND. Rumor has it that a group of possibly four to six operators will be active from here beginning sometime in March. Activity will be on CW/SSB/RTTY, all bands, with an emphasis on 160, 80 and 40 meters.

8P9, BARBADOS. Steve, K2WE, will be here February 17-24th and active as 8P9AP. He will be staying on the south shore of the island in a place called St. Lawrence Gap. He plans to be active in the ARRL CW DX Contest and will be operational on all bands. QSL via homecall (ex-NI2C).

9G, GHANA (UPDATE). G3VMW, G3XAQ, G3ZEM and G4ZVJ will be active from Accra in Ghana during the month of February, 1998. Andy, G4ZVJ, will be active from February 5th through March 1st as 9G5VJ, and will be active in the FOC Marathon. He will be joined on February 12th by Alan, G3XAQ, who will be active as 9G5XA until February 23rd. Steve/G3VMW and Bob/ G3ZEM fly to Accra on February 20th to join the others and will be active as 9G5SW and 9G5ZM on all bands. They will be active during the ARRL CW Contest and the the RSGB 7 MHz CW Contest. Activity will be mainly on CW but with the possibility of some RTTY and SSB if required. QSL routes: 9G5SW via G3VMW or RSGB Bureau, 9G5VJ via G4ZVJ or RSGB Bureau, 9G5XA via G3XAQ or RSGB Bureau and 9G5ZM via G3ZEM or RSGB Bureau.

9G, GHANA (Another ham in Ghana!). Steve, PA3GBQ, reports to OPDX that he will be traveling to Ghana in the first 3 weeks of February, 1998. He explanins that this is not a DXxpedition but maybe he will find some time and equipment to operate on the ham bands. He will be traveling throughout the country. His probable callsign may be 9G5BQ. QSL via PA3GBQ (1998 CBA) or bureau.

D6, COMOROS ISLANDS. Start looking for Martin, HB9CYN, and Chris, HB9CYV, to be active as D68YN and D68YV, respectively, until Febraury 6th. Their activity will be on 160-10 meters all bands, mainly on CW but with some SSB. They will also be on RS-12/13 satellites. SORRY NO RTTY. QSL routes are: D68YN to HB9CYN and D68YV to HB9CYV. (QSLs via bureau preferred, Direct: Oversea mail with 2 US-$ needed, Europe 1 US-$). Stations worked can be found after the DXpedition on the following Web-Page:
http://ab5eh-lin.tamucc.edu/~hb9cyn
Also, QSL requests (via bureau) may be sent to the addresses mentioned on the WWW-site above.

FS/FJ, SAINT MARTIN. Dick, K3DI, will be here and active as FS/K3DI. He hopes to get a wire up and be on during the CQ 160M SSB Contest on February 28th and March 1st. Also, he will be active in the REF SSB Contest during the same weekend. QSL via his homecall (listed down below under VP2E) or via his E-mail address for bureau replies: wilder@clark.net

KG4, GUANTANAMO BAY. A RTTY team will be at GTMO for the 4th Annual World-Wide RTTY WPX Contest Sponsored by Hal Communications Corp! Team members are: Bill/KG4GC (W4WX), Rusty/KG4AU (WV3N), Jan/KG4QD (K4QD), Joyce/KG4OS (WA4OMS), Wayne/KG4WD and Clayton/KG4PK. Look for KG4GC to be used during the contest February 14-15th. Members will arrive at GTMO on the 13th and depart on the 20th of February. The team will be active after the contest on all modes and bands. A special thanks to Rusry for sponsoring them! QSL Contest QSO's to: Bill Gallier, KG4GC/W4WX, 4094 Sandy Run Drive E., Middleburg, FL. 32068.
Please include a SASE. Bureau cards will also be answered. Non-contest QSO's go to home call. Any comments or questions can be sent to: w4wx@bellsouth.net

KH1/KH5/KH5K, BAKER/HOWLAND ISLAND, PALMYRA ISLAND AND KINGMAN REEF. Seven operators of the South Sandwich Island Antarctic DX Group (SSIDXG)

and the Midway-Kure Island DX Foundation (MKDXF) plan to be active again from these two islands. Activity will begin February 4th with a 3-5 days operation from each islands. Activity will be on CW/SSB and RTTY. OPDX InterNet Subscribers will receive the official press release as an additional bulletin.

MW8, WALES. Operators G3NKC, G3NLY, G5LP, G4BWP, G0KRL and others to be confirmed later, will activate the Welsh island Anglesey (EU-124) in the IOTA contest later this year. Their callsign this year will be MW8Z. (Previous operations were as MW7Z, MW6Z and GW5LP/P). More information will be forthcoming. QSL MW8Z via G5LP.

QSL INFO AND NEWS.....
Kaz, DL6FDB/JA1IST) and Joe, JA1LZR, who operated from HB0-land last weekend (Jan. 16-18th), made a total of 1500 QSOs. QSL HB0/DL6FDB to DL6FDB or via bureau. QSL HB0/HB9LEY via his QSL Manager, JH1BSE or bureau.

An update to QSL Manager Michel, HH2HM, states he is only the manager for UA0FDX, BA4TB, T95LGN, EX2M, HH2PK, UN7EG and UN7FJ. Also, the only valid address is: Michel Hamoniaux, PO Box 104, 22650 Ploubalay, France. Some other sources (such as Buckmaster) show a Hatian address for HH2HM. Michel asks that requests go only via the French address.

IS IT BOGUS OR NOT? Steve, VK3OT/KL7, of Wasilla AK, reports to OPDX a station was heard, VK9YQS working 40M CW to Japan. Steve states, "In my opinion, although VK9YQS is on Macquarie and has been worked on 6M band, his licence class is technical and as such he does not have HF priviledges, Also, I am not his QSL manager since December, 1990. In this case, the WFWL will not work unless there have been some changes to the Aussie laws permitting Limited licencees on HF. I was also unaware Doug ran CW on any band. So I suggest people ask one of the other VK0's like GW or ask VK9NS to investigate this."

Paul, N5PGI, reports he worked a 9K2RR (May 97) who said QSL via K1VKO. K1VKO advises that he is NOT and NEVER HAS BEEN QSL Manager for this station (or any other for the last 5 yrs).

EP2MKO - Bill Moore at the DXCC Desk advises that this station is OK for DXCC. QSL via UA6HCW.

SPACE "A" DXPEDITION GROUP". Bill, W4WX/KG4GC, is interested in forming a "Space "A" DXPedition Group". Members would be from all over the world. Only requirements would be: [a] retired military with space available privileges, [b] have email address. The group would communicate via e-mail and organize at least one DXPedition a year. There are many places available to visit via military air. In the past couple of years, Bill has been to CU, JA, V2, HP1, HP3, KG4, KH6, KP4... With some help on arranging transportation and permission, Bill states they could go to places like: HR, VP9, KH2, WH0, HH, VQ9, HZ and many other military facilities!! Send your thoughts and ideas to Bill at: w4wx@bellsouth.net

SPECIAL EVENT. The 1998 Winter Carnival Special Event Station will be using the a special 1x1 callsign W8C beginning Thursday, January 29th at 1100z and lasting through Saturday, January 31st at 1100z. Suggested operating frequencies will be on or near: 3984, 7246, 14256 and 21336 kHz. The Husky Amateur Radio Club, at Michigan Technological University, will be operating the annual Winter Carnival special event station. There will be certificates available. For more info on the Husky Amateur Radio Club, visit the website at http://w8yy.resnet.mtu.edu or, for more information on Winter Carnival at Michigan Tech., stop by the MTU homepage at http://www.mtu.edu

"THE NEW DXCC RULES -- WHAT WAS CHANGED?" Editorial by Tedd Mirgliotta, KB8NW. OPDX InterNet Subscribers will receive this as an additional bulletin. If you are not a subscriber and did not receive a copy of the new rules, send a message (E-Mail) to opdx-request@nshore.org along with the word "archive" in the "Subject:" line and then use the command: get volume98/340.1 (command is case sensitive). Also, you can get a copy from the official OPDX HOME PAGE (provided by John, K8YSE): http://www.en.com/users/k8yse/opdx.html

THAILAND/MALAYSIA 40 METERS NET. HS1RU net control of this 40 meter net on 7060 kHz at 1300z will now listen on 7153 every day at 1330z for any USA stations that wish to work him.

V2, ANTIGUA & BARBUDA. Team Antigua will once again activate V26B from this beautiful Island in the upcoming ARRL DX Contests, both CW and SSB. Their entry in both contests will be a Multi-operator/Multi-Transmitter catagory. QSL V26B to WT3Q. The following are the operators of V26B (with their own personal V2 and QSL routes): V26A (Dale/N3BNA via WB3DNA); V26B (Sam/WT3Q via WT3Q); V26DX (Doug/W3CF via KK3S); V26E (Darrell/AB2E via AB2E) and V26U (Bill/W2UDT via W2UDT). Other operators included: John/N2NC, Andy/N2NT, John/WA2C, and possibly a few other operators will be added to these two operations. Please note that in Team Antigua there are many Frankford Radio Club Members. The Frankford Radio Club, celebrating its 70th anniversary, has extended its qualifying period for their beautiful award. Additional information about the Frankford Radio Club and the 70th Anniversary Award can be found at the following WEB site: http://www.frc-contest.org

V3, BELIZE. A joint IOTA DXpedition between the members of the Southern CA DX Club and the Bay Area DX Association (MI) will activate South Water Cay, Belize (IOTA NA-180) for the period 3-10 February 98. Operators will be V31VI (N6KZ), V31UY (N6UY), V31NX (N6FH), and V31TR (K8BK). Operations will be on all bands 10-160 meters on both SSB and CW. Equipment will be 100 watt transceivers with verticals and one 3-element triband yagi. Electrical power will be from a solar-charged battery system. QSL to home US calls.

VK0, MACQUARIE ISLAND. The 59(9) DXReport states Tom, VK0TS, is now back in Australia as VK1TS. He may go back in 1999 with better gear. Currently there is only one amateur on the island and only on UHF.

VP2E, ANGUILLA. Dick, K3DI, will be active as VP2EEI in the ARRL CW Contest (February 21-22nd). QSL via homecall (Dick Wilder, K3DI, 913 Shore Acres Road, Arnold, MD 21012-1724) or via E-mail for a bureau QSL: wilder@clark.net

YS, EL SALVADOR. The DX-group from Finland, originally aiming to activate Guatemala, has now crossed the border of El Salvador and has activated YS1X, especially for Europeans. TG0OH and TG7/OH3JF operations have been cancelled (NO other details given). The group will be active until Friday, February 6th. They will be near the City of San Salvador, at the QTH of Raymundo, YS1RRD. YS1X is the "contest" call sign of YS1RRD. Operators include: Carl/OH6XY (CW, RTTY), Toni/OH1TD (SSB), Heikki/OH3JF (CW) and Raija/OH7LIX (SSB). Suggest Frequencies:

CW: 1827, 3507, 7007, 10103/10108, 14007, 18077, 21007,
24897, 28007. ("Seven up" from bottom)
SSB: 1840, 3789, 7045, 14195, 18145, 21295, 24945, 28495
RTTY: 14088, 21088, 28088

One station will be on for 24 hours per day. Second and third stations will be on at least 16 hours per day. The fourth (QRP) station will occasionally be active. QSL via OH2BU, Jari Jussila, Pilvijarvi, FIN-02400 Kirkkonummi, FINLAND

1998 DAYTON DX DINNER ANNOUNCEMENT. The Southwest Ohio DX Association is pleased to announce the Thirteenth Annual DX Dinner to be held on Friday, May 15th, 1998, at the Crowne Plaza Hotel, Dayton, OH. There will be a cash bar at 6:30 PM and dinner at 7:15 PM. Tickets are $30.00 and must be purchased in advance. Groups wishing to sit together must order as a group. A table seats eight. Please make your check or money order payable to SWODXA and send an SASE for ticket return. Seats will be assigned in the order that requests are received. Seats will be assigned on 15 March 1997. Seating is limited. Please order tickets from Tom Inglin, NR8Z, 4061 Eaton Road, Hamilton, OH 45013. For information on the dinner, contact Steve Bolia, N8BJQ at (937) 788-2803 or e-mail to n8bjq@erinet.com. Check the SWODXA homepage at http://members.aol.com/SteveB4622/index.htm for updates.

Slickster...but rest assured, you're NOT
>going to wiggle out of this one.

Drew, in spite of the fact that I am largely in agreement with you here, I really don't think this is the place for a post on this topic, nor the place for spewing so many personal insults that no doubt would get you started in a good knuckle-and-skull session had you delivered them to the insulted party in person. Why can't you tone it down a bit? We are here to discuss topics related to Amateur Radio, not to call each other or anybody else a lot of names.

You worry about being unmasked and harassed for your posts, yet you continue in the same vein. You CAN be a gentleman and still voice relevant opinions here... the two things are not mutually exclusive. It is only the grudging respect for your privacy and the typical politeness that still infects most hams that keeps those of us who know who you are from broadcasting your callsign, address, physical description, etc etc etc. Yet you continue to act like a... well, act badly.

If you are kicked around in real life so much that you feel a need to lash out anonymously and irrationally on the usenet, try to find some counseling or something. We are here to discuss ham radio type topics. I think the name of this newsgroup is "rec.radio.amateur.misc", not "alt.trash.slick.willie" or "rec.radio.CB.10-4,good.buddy". Again, I would point out that even those of us who hold fast to controversial views here usually do not do so anonymously, nor do we generally give voice to them in an offending or irrational manner. Why not get with the program?

You "know" nothing of the sort. You are merely parroting what a few others on this newsgroup have suggested.

Go ahead. Broadcast "Drew's" callsign, address, physical description, Social Security number, and whatever else you can get your hands on. Maybe someone will then contact "Drew" and he can confront you, asking why you and your friends continue to make these accusations and allegations against him, despite a lack of proof to back up your claims. If you're lucky, this is all he will do. If you're not so fortunate, he may well consider taking legal action against you for possible libel and/or defamation of his character.

Source record: 180594

I'm trying to locate parts for the following portable radios

Motorola HT 220's
groups of working radios that will talk to each other...
also Parts, antennas, batteries, etc.
UHF in the 460 to 470 width
VHF in the 150 to 170 width

General Electric MPR, I have 2 in UHF low band Batteries, Charger Tx-Rx
Elements Antennas (I'm also willing to sell (or Trade) these two radios
if your interested? they will operate 420 to 450 Amateur band)

Motorola MX series
MX-360 VHF (150 - 170)
Channel Elements,
Antennas
Batteries
Chargers
(I have 40 radios all 4 channels)
(these radios are also for sale or trade if your interested)

MX-350 UHF(2 radios-one 2ch, one 4ch)
Same as above

MX-340 VHF, MX-300-S (2 radios,4 channel)
as above except Eprom needed

Please let me know if you can help or point me in the right direction
(These radios are for a non-profit educational organization and your help
is greatly needed)

Thanks
Driver

>Amateur radio has seen consistant growth in its licensed numbers since
>its inception.
>
>The idea that "amateur radio is going away" is nothing more than yet
>another of the "10 Big Lies of the No-Code Agenda".

Actually, Michael, my concern is not with our absolute growth in numbers, but in our growth (or lack thereof) in percentage of our national population. You, perhaps, and others have pointed out that the influx of "no-code" hams is an artificial "hump" in the statistics. Keeping them in, we lose ground less quickly. Dropping them from the statistics, we are falling behind population growth more quickly.

Go back 10 or 20 years and note our percentage of the who population. One might reasonably assume that THAT figure would represent the normal percentage of people in the general population who might be expected to be good at ham radio.

The question is: why has that percentage declined?

The next question is: what can we do about this, if anything?

The no-code-test people would point to the code as the problem.

The pro-code-test people would point to attitudes of prospective hams.

Some might point to the attitudes of present hams.

Is ham radio "going away"? In terms of absolute numbers, no (not yet). In terms of relative popularity of the hobby -- it sure seems to be, except for the no-code influx. If we don't want ham radio to "go away" eventually, we will need to make some changes. I know you stand opposed to "no-code-test" HF. What do you suggest to regain "our share" of the population?

>"No-Code-Test Agenda" might better describe people like Bill Sohl, it
>does not accurately describe all people who profess anti-CW views in this
>newsgroup.

The problem with the phrase "No-Code Agenda" is that the term "agenda"
implies a concerted, co-ordinated effort and a definite series of steps, a
planned effort. Using it with the term "No-Code" asserts that the forces on
the opposite side of the issue from you have conspired together to define a
planned attack to remove all use of code from the amateur bands.

While you might believe that you see such a conspiracy, the mere opposition to the code test does not constitute such.

Your right to define phrases is somewhat limited to the normal meaning of the words involved.

Thus, to many people, "No-Code Agenda" is an inaccurate reflection of their position, and thus (almost) as defamatory as the unjust "Pro-code Nazi". They both really are improper.

A statement true for some people, not for others. Personaly I, like
many others don't have a schedule that is the same day after day. Me
on Thurs. Tues. and most Weds, and fully half Sats. I can barely find
time to eat, let alone do something like practice Morse Code. But after
I get up on Sunday, I can do as a please til Monday night. Morse takes
that day to day grind, to learn, day to day time that is hard to find in
many people lives, does that fact mean they would not be good Hams if
otherwise interested etc. or that they lack time to operate. nothing
in 97 says that to be a good hams you have to tranmits every day.

Yup. Although, I would disagree with you that such an agenda needs to be
"coordinated". All that is required is enough people to believe in it, and
spread the word. There does not need to be a 'controlling' agency/person,
as it were.

>Using it with the term "No-Code" asserts that the forces on
>the opposite side of the issue from you have conspired together to define a
>planned attack to remove all use of code from the amateur bands.

Sorry Larry. I can't buy it. The Codeless Tech license is referred to as
the "no-code license". It was back in the 80's, it is today. History
created the definition. Not me. Using the term "no-code" in describing
the agenda, as the agenda is merely an extension of the logic presented
for the no-code license back in the mid-80's, is perfectly proper.

>While you might believe that you see such a conspiracy, the mere opposition
>to the code test does not constitute such.

Conspiracies? Nah.

>Your right to define phrases is somewhat limited to the normal meaning of
>the words involved.

Lessee... "No-Code" (see: Codeless). "Agenda" (see: plan). "No-Code Agenda"
(see: Codeless plan). Yup, it fits.

>Thus, to many people, "No-Code Agenda" is an inaccurate reflection of their
>position

That's certainly your opinion, you're entitled to it; I happen to disagree.

You can order just about any part of the htx-202 thru Radio Shack. Get the service manual first as it has part numbers and schematics and makes it easier for the usually non-technical sales people. I do not work for Radio Shack so this isn't a plug for them.
I've just serviced a few for friends. 73 Paul N8ULS

> law. Federal law preempts state or local law.

Three points of interest here:

1) Federal law does preempt state law in cases where the Constitution specifically addresses the issue. The Constitution does not address the issue of radio or telephony. Reference the Tenth Amendment.

2) Law enforcement may obtain court permission to make recordings that would otherwise be illegal. This actually is germane to amateur radio in a way. The Telecommunications Act of 1934, and subsequent Federal and state laws make it illegal to repeat to any other person what you hear on non-broadcast frequencies. Thus, if Newt had been talking on 40 meters, about some illegal activity, such a tape would be inadmissable in court.

3) Kenneth Starr may be operating under Federal law, but he is still compelled to obey state law, and if he asked Tripp to make these recordings, he may have violated the law of MD or VA, or wherever the hell it was.

I believe ....who started when...who started how....or who started why in this fine hobby is illrevalent to any reasons why we must learn CW to upgrade for priveliges on the low bands. It's the rules we must adhere to & respect. Sure time moves on...we don't drive horse drawn buggies, but they do exist. A law student must study solved cases, a history student must study the alimo, we must take a driving test for a drivers liscense. Ham radio is a privelege not a right that must be earned not easily obtained.

Hi N1...

I read your message more closer when you sent it but, for some reason, did not respond.

When I got my licence, back during the mid 60's, part of the written exam was to explain how to reduce just what you are taking about. Amateurs, and theoretically anyone else using the radiio spectrum, are supposed to have their equipment adjusted in such a way as to prevent a distortion of their signal, eg harmonic suppression, over wide signals, etc

One of the results of a distorted signal, usually, is interferene with other services and we, as amateurs, are not allowed to interfer with other radio services. To the opposite of this a clean signal also, usually, results in a better soundiing signal to the station you are trying to communicate with.

Most of todays radios have built in circuity which is designed to reduced harmonics and overwide, spatter, transmissions. However, as you have probably already noticed many operators are modifying their radios to get more out of them and, as a byproduct, produce a signal with splatter, etc.

If the radio is properly maintained it should work within the fcc, etc, regulations.

To answer your question, yes, every radio operator's responsibility to do everything possible to maintain a clean signal with no harmonics or other spurious signals.

p.s. it is our responsibility not just good operating procedure.

Hi Mike

1. most amateur, who have been using the code for several years and
have reached 20 wpm, consider 5 wpm as rather slow, you will after you
have reached speeds of 10 plus..

2. My congratulations on your starting to learn the code. I found it
a somewhat difficult task to undertake and I do wish you success.

3. There is no real reason to put down the code. You will find that
you will have many happy qso's on cw. Don't be too quick to criticize
it because of this code nocode debate. Give yourself at least 2
yearss of heavy code use before you determine its value to you. It
does have merits regardless of what people say.

Greetings

I am a volunteer at an annual amateur radio display at a local fair.

last year, one of the volunteers brought down a book on antennas. I
spent a few hours, over a few days, flipping through the pages.

Those of you who like, or would like, to build your own antennas might
find this book of value. Though it was primarily aimed at the amateur
radio market, it also had a chapter on CB antenna construction.

I wrote down some of the pertainant information. The author is kr6a,
W. Clem Small

The book is titled 'The Antenna handbook'. $13.00 u.s.

The ARRL was singing the same tune in 1934 when they lamented that HF phone could never support more than 16,000 amateurs, so code test speeds needed to be raised to limit access to phone operation. They were, of course, wrong. So are you. Amateurs adopted better technologies and sharper operating practices to cope with the increase in HF phone numbers to 368,000. In other words, the ARRL was wrong, and not by just a little bit. They were wrong by more than 23x. The reason that they were wrong was that they lacked the foresight to see the effects of technological change, and the pressure for that change which increased numbers brings.

Even today we are orders of magnitude below the Shannon capacity limit for HF. And technologies such as low rate codecs and spread spectrum could allow us to accomodate millions of amateurs on HF. But that won't happen as long as we cling to 1934 attitudes.

>>Many people are crying about Amateurs not being innovative or

>followers, not leaders. You can only name a few dozen amateurs who
>really contributed to the advancement of communications; eliminate the
>expensive labs and funding their company provided, and the numbers are
>much less.

Indeed, only a fraction of a percent of amateurs are innovators. And that's also true of the population as a whole. It is a bell curve. And there is no reliable way to predict which amateur, or which member of the population as a whole, will be the one to drive innovation. Who could have guessed that a portrait painter would popularize wireline telegraphy? There is no test we can use to determine such things a priori. But a rising tide lifts all boats. We do know that if we increase numbers we will also increase the numbers of that tiny percentage who will be innovators.

You are wrong about corporate labs, however. Most innovations by amateurs have been done outside of corporate labs and without corporate support. In fact, the era of the large corporate lab as a source of innovation is over in general. Most innovation comes from humble locations, done by people working

on shoestring budgets. The beginnings of the microcomputer revolution are illustrative of that. Most of the primary work was done on kitchen tables and in garages. Only later did the big corporations commercialize it. This was an example of the amateur spirit at its best.

Wireless communications is entering a revolutionary period where most innovation involves signal design, coding, and processing, IE its all software and firmware. That's cottage industry at its finest. Anyone with a PC and a compiler can participate on the same footing as a corporate worker in a cubicle *if they have the incentive to do so*. The corporate worker's incentive is a paycheck. The incentive for the amateur is to be able to do something neat, IE the classic hacker ethic. But when the regulations restrict his ability to actually use what he invents, there is no incentive to invent.

>> Many people, who would be interested in Amateur radio are put
>>off by the code requirements.
>
>Everything above 50 MHz is available to them. Almost 130 MHz between

>conducted in that region.

None of which involves F layer propagation as you very well know. HF is a *very* different environment from VHF+. It calls for very different techniques and a very different approach. It is not a benign line of sight gaussian noise environment. Different signal designs and different signal processing techniques are required to optimize its utility. That's precisely what makes it interesting, and what makes it attractive to the hacker ethic which drives amateur innovation.

>> but we need a constant infusion
>>of new people and ideas or the ARS will not be competive with the newer
>>technologies.
>
>Ummm, who are we supposed to be competition with? The military? The
>maritime service? The telephone industry?

All of them and many more. They are all competitors for spectrum allocations. If amateur radio is not seen as making best use of its spectrum, any of its spectrum, it puts all of its spectrum at risk. We are all tarred with the same brush. We know that most innovation is done by people under 30, but most current amateurs will never see 30 again. That's why we need a constant infusion of new amateurs with fresh viewpoints and new ideas. If amateur radio is to hold its own against other services, it must show that it still offers value to the nation as more than a playground for a select group of senior citizens with archaic skills.

Well, he won't learn them by joining the ARRL. Most areas do *not* use
the ARRL bandplans (at least not in toto) . Bandplans on VHF/UHF are
local agreements, and the best way to learn about them is to ask other
local amateurs.

Portable EMP devices do exist. Police have been experimenting
with them as a method of stopping speeders. The idea is, trash
the engine control computer and the engine stops. Of course
trashing the ABS computer could have somewhat different
results. I expect the lawyers will have a field day over this one.
Trashing over a thousand dollars worth of control electronics
to collect a $30 fine could lead to some very interesting liability
cases. Police have already found themselves in hot water by
using punji mats to puncture tires. Seems they tried them on
I-75 up in Tennessee and wound up having to buy over 100
motorists new tires.

>say and who to talk to, and I would have possibly regretted somewhat my choice
>for my first VHF rig.

Actually, most serious VHFers will acknowledge that the HTX202 is the
best currently available 2m handheld. The receiver has the best front end
filtering of any HT on the amateur market. Unfortunately, it isn't a dual bander,
so it doesn't meet the poster's requirements.

Most serious VHFers will also say that starting out with a HT is the wrong way
to go. A mobile/base radio is much better than any HT. And I would add that for
one starting out, buying a *used* mobile rig is the way to go. It has already taken
the big depreciation hit that occurs when it is first taken out of the box, and it
will lose its remaining value much more slowly. So if it doesn't exactly meet
your fancy, you'll be able to resell it without much loss. Nothing very revolutionary
has happened with mobile dual banders in the last couple of years, so you won't
be at a disadvantage by buying a used radio.

Not all that small with respect to a wavelength at cellular frequencies.
The fuselage actually becomes a pretty good waveguide slot radiator
at cellular frequencies. Do the math.

>Passengers may break rules and attempt to make phone calls but do
>they ever succeed?

They do on the ground, but after the plane reaches altitude they hit so
many cellls the cellular system becomes confused.

>So when did the editors of those magazines vote and pass the
>changes needed? Seems to me MD misses the reality of the
>situation in that it was the FCC that made the change happen
>and no one else.

Well Bill, if this is the case, then why all your belly-aching here about a codeless HF license? Seems to me that if expression of your opinion publically is irrelevant, since only the FCC will make change happen, that you should be spending all of your time writing to the FCC and none of your time posting to USENET about the glorious benefits of a codeless HF license.

>Seems that if there wasn't a codeless tech license we'd have far
>less hams than we do now.

Hmmm. So, is your sole criteria "bodies"? What else can we do to ham radio to increase the number of bodies? Lesseeee... If we gave away licenses in boxes of Fruit-Loops and Frosted Flakes, we'd get a lot more "young people" in the hobby! Yeah, that's the ticket.

>Additionally, I recall no one saying
>we'd have hoardes of high tech types coming in.

Revisionism in action. Go back and re-read the editorials and letters from the mid-80's to 1988 in QST and other magazines.

>That's more a problem (IMO) with a code requirement today than
>with nocode.

There is no evidence to support your assertion. Only your personal bias woven into a "crisis" for ham radio.

>Hey Mike, in other posts you say people are upgrading which
>is why there are more extras today than a year ago. Which is it.

The fact that there is a reasonable percentage of people upgrading beyond codeless tech is irrelevant to the fact that the license is a "dead end" license. It was specifically created for people who don't want HF access. It represents the one and only license class that the majority of people holding it will ever have.

>Once again, MD tries to taint the nocode TEST group by
>ignoring that many of us ARE coded hams with higher than
>tech licenses.

So? Its just the same crowd from the mid 80's.

>Bure unadulterated trash. MD wants you to believe that the
>nocode TEST group wants to BAN CW. That is bull and
>he knows it. There hasn't been a single post from anyone that
>would even appear to want that.

The pure, hate-filled vitrol posted by the No-Code Agenda Poster Boy, Carl Stevenson -- his disdane for anyone who enjoys operating CW, his open hatred against older hams, all available for anyone to read by visiting DejaNews -- is more than enough circumstantial evidence to show that the true motives of some (not all) of those involved in the No-Code Agenda is to completely ban CW from amateur operation.

>The reality is that neither I nor anyone else posting
>here in support of ending code testing has promised MD or
>anyone else anything as regards the nocode tech license.

More backpedaling.... Kind of like Bill Clinton: "err, I never had sexual relations with that intern" (of course, since Clinton doesn't consider oral sex to be 'sexual relations', he believes he is 'telling the truth'.) In a similar vein, Bill Sohl claims "I never promised you anything". Well, he is right -- he never did. Of course, the movement which he is part of, that he identifies with -- did promise certain things.

>MD also ignors again the large expansion
>of the Novice and Tech question pools in July of 97.

Double nothing is still nothing.

>>There is no resistance to change in amateur radio. Amateur radio is many
>>things to many people. Some like EME, some like CW.
>
>To bad MD doesn't believe what he writes in terms of appropriate
>test requirements.

Bill Sohl ignores numerous postings from myself where I publically state that I openly support "mode-based testing", where individuals are only tested in those modes they wish to operate.

They replaced it with a General Ticket then did away with the need for
the General. You don't need a ticket to work on these radios any
more.

Ron

I don't know that tapeworms could do it, but it is Pavlovian conditioning.
If you've ever attempted to condition a flatworm or dog, however, you
know it isn't easy. And the higher the intelligence of the subject, the
harder it becomes. Conditioning requires *unthinking* response.

Actually, it would be the converse. Those smarter than Pavlov's dog's
tapeworm might have real difficulty. Of course those of you who simply
can't think at all have a real advantage.

1) 97.503(a) is an administrative regulation, not law.

2) The FCC has publicly stated that the only reason Morse testing remains
is because "the amateur community wants it", meaning in reality "the ARRL
wants it".

The only way that's going to change is to change what the ARRL wants.
And that means changing the minds of the radio amateurs who ultimately
set ARRL policy, IE its paying customers. Since the ARRL certainly isn't
going to make any meaningful efforts to publish views opposing its policies,
that leaves forums like this for use in that effort.

> a real estate agent?

I think you miss his point. What the FCC 1st phone requirement provided was some regulatory impetus for stations to keep the licensed engineer(s) in their employ.....hence there was a reasonable-sized (if not huge) market/demand for one's services. As the requirement was gradually eliminated -- 1st for directional AM operators, then for TV xmtr operators, next for chief operators, etc., etc. (doing this from memory, sorry if I messed up the details) -- the "market" for licensed 1st phones shrank, and hence the employment opportunities. Combine this with the overall consolidation in the radio & TV industry, etc. as well as the rapidly diminishing (as seen by many owners) need for 'traditional' equipment maintenance [say what you will about the chief engineer's --or even just skilled broadcast engineer's-- penchant for planning, foresight, preventitive maintenance, etc.......most stations just think of 'em as fix-it guys NOT members of the management team of professionals] and it's not an attractive picture to many as a career position. Obviously there will always be itinerants who work as contractors for several stations out of their pickup trucks and service vans, as well as the handful of folks at the big market stations, who continue to make it happen and do OK --- but I venture to say that many stations these days do not even have a "chief engineer" anymore. Would be interesting to check the listings in "Broadcasting Factbook" or similar to see how many are shown.

Driven by the regulatory requirement, stations provided opportunities (i.e., jobs) from which the talented and energetic could grow & excel. [And yes, the deadwood could drag along, but that's not my point here] Now a days, those opportunities are much more scarce and harder to hang onto if you do land one and can put up with the BS.

On the other hand, there are *lots and lots* of real estate offices around, each employing real estate salespeople, agents, etc. Unlike the high cost of entry into the broadcast business (if you even wanted the hassle of owning your own station), many brokers even start their own real estate businesses if they want to be truly independent businessmen. The point is that there are many more opportunities to make something of yourself in real estate.

On an apples-apples comparison basis, you have a better chance of prospering in real estate than in broadcast engineering.

Been there, done that, by the way. I started in Broadcasting in 1973 (P1-20-15378), worked my way up through operations & maintenance (mostly TV, some FM), put myself through college (B.S.E.E.), and worked as CE & Engrg Mgr of commercial UHF station for 4 yrs. But I could see the writing on the wall, and left the field to get my M.S.E.E. No, I'm not in real estate (although some days I've thought of it :-) but I've never regretted the move from broadcasting (although I do miss some things about it).

We're a bit off the ham radio topic (what's new in this newsgroup :-) but I thought I would reply.

The "No-Code Agenda" doesn't exist because nobody wants to ban CW. The "no-code-TEST" agenda exists. A lot of people want to ban the outdated Morse code exam requirement. Why do you continue to make the mistake of using the totally inaccurate expression, "No-Code Agenda"? Why not use the accurate expression, "no-code-test agenda"? Are you trying to sneak more irrational emotional content into the subject than really exists in reality? Isn't using the expression "No-Code Agenda" just as bad as the other side using the expression "Pro-Code Nazi"? Both expressions are inaccurate and designed to elicit an emotional response instead of rational thought. If you want to divert rational thought from the outdated code testing requirement and promote your Big Lie, then continue using the emotionally charged inaccurate expression "No-Code Agenda". But realize that everyone knows what your are doing and why.

Does anyone have a book on programming a SoundBlaster card they'd be willing to part with? I'm not interested in the MIDI stuff so an older book would probably be fine. I want to incorporate the sound card's features in ham oriented computer programs.

Email me if you have something. I tried Barnes & Noble and Amazon but all the SoundBlaster books I've seen are evidently out of print and unavailable.

TIA.

Ken

The key here is two fold:

The first is Tripp making phone recordings from her home in Maryland.
The question here is where was the other party at the time? If she was
in MD then it was a state crime. But if she was in Virginia it was
legal (only one party needs to agree). If she was in the District
(D.C.) I am not sure what the law is in this case.

The second part is that the Special Prosecutor used the FBI to make
the last tape, in a Virginia hotl with both parties present in the
room, where it is legal if only one party agrees to be recorded.

Unusual AKAI/ROBERTS 1725-8L III REEL TO REEL & 8 TRACK DUB DECK

A Very Unusual deck for 8 Track lovers. This unit was probably made by Akai is my guess for Roberts. Says Made in Tokyo Japan on it.

From the Back of the Unit it states:

MULTI-PURPOSE TAPE RECORDER

4 Track Stereo/Mono Reel to Reel
8 Track Stereo Cartridge
Transfer from reel to Cartridge

The unit appears physically in fair to good condition for its age. I do not have a power cord to fit the unit or manual, so I cannot vouch for its mechanical condition by testing it. It is best to assume it may need some attention or for a parts unit.
$45 or best offer

OR SWAP FOR TUBE TESTER.

Plus U.S. Parcel Post Shipping costs which are not much.

I'll pack it free

International buyer welcome.

I am *committed-to-change* ... not "obsessed" ... I attack flawed ideas
that result in decay and stagnation ... and occasional the more onerous
deviant personalities/philosophies amongst you fanatical pro-coders ...
like Larry's recent "go away kid we don't need/want your kind" shpiel, for
example.

The last two phrases in your last paragraph above are somewhat true, however.
(Many) older hams, the ARRL, pro-code supporters, etc. (are) Truely sad and
pathetic. Their backward ideas/ideals, stagnant thinking (if, indeed they
think at all), and the decay they have caused in amateur radio over the past
several decades is appalling. But, I am sure you are quite proud to be "in the
top 10" (of the most rabid, irrational pro-coders on usenet).

rl>candidate said that, "we cannot lower our standards by any further
rl>reduction in code testing requirements"

Narrow minded thinking like above IS the prime reason amateur radio is slowly going away. Morse code!?!..really, why don't we all just demand the major car manufacturer's revert back to the model-T. MOrse code will not eliminate "lids"..witness the "section managers" statement..jmho.

Regards.

2314. Can I use a power supply as a trickle-charger?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-25 00:00:00 UTC
From: cbrambo@aol.com
Message-ID: <19980125173800.MAA02133@ladder02.news.aol.com>
Source record: 180664

Just hooked up a small utility battery (170 CCA) to power one of my radios here in the house. Radio draws about 7A peak on transmit, and this seems to work well. Planning on wiring in a trickle-charger (1-2A), and leaving it plugged in to assure the battery always has a full charge. Wal-mart sells these for $16.95. Apppears to be nothing more than a wall wart type power supply with 120VAC in and 12VDC out @ 1A. I have several wall warts in my "junk box" with the same specs. Can I simply cut off the plug, attatch the wires, and use these? Or is there something "special" inside the trickle-charger that makes it more appropriate for battery-charging applications?

CBRambo wrote:

> At least Nixon had morals. He didn't sleep around on his wife or loathe and detest the military.

Morals huh.....What have you been smoking?
Here is the guy who prosecuted the Vietnam War with a savagery that made LBJ look mild. Carpet bombing Hanoi, authorizing the secret bombing campaign of Cambodia without Congressional approval. Giving the go ahead for the ground incursion into Laos. When the people of Chile elected Salvador Allende as President he and Henry Kissinger employed the CIA to violently overthrow it.

Your view of morality is the perverse conglomeration of contradictions found on the Facist Right. You claim to abhor the state but back despots who use the state in all its feury to crush governments and groups you don't agree with. And then you crow about freedom and democracy. What you stand for is freedom and democracy for you and everyone that thinks like you.

Yes it sure looks like Ken Starr has finally dug up some dirt on Clinton. Which may lead to his resignation. But the indescretions made by Clinton are trivial to the point of insignificance when compared to the atrosities committed in the name of the state by leaders you revere.

It's this same distorted moral code that lead Timothy McVey to setoff a truck load fuel oil and fertilizer in front of the Murrah Federal building killing scores of innocent Women and Children in the name of getting a few federal agents.

Mr Rambo the bilge you spew forth comes from the point of ignorance of history. Someone who only gets his information from Rush Limbaugh, G Gordon Liddy and the American Spectator.

There is NO "circumstantial" evidence to support Mike's lies that I
"have a true motive of completely banning CW from amateur operation."
I (and many others) have REPEATEDLY stated publicly that no such desire
exists and have committed NOT to seek or support any such outcome.
I (and others) have even VOLUNTEERED to support the establishment of
"Morse only" sub-bands (say 25 kHz per HF band) where other modes would
be excluded so that Morse users would always have space to practice
their preferred mode without interference from more modern modes that will
ultimately proliferate. (Note that Morse use would still be permitted on
ALL amateur frequencies, as is now the case.)

Bottom line: Mike lies so much he can't tell the truth from the lies.
While I think Clinton is a lying, crooked bastard who should never have
been elected and should be kicked out of office, I find it incredible
that Mike has the cajones to rant about Clinton, since Mike is AT LEAST
as big a liar as Clinton.

---------- I disagree. Many people are interested in the hobby but not with the same issues as your nor necessarily aware of the importance an issue may pose.

At this point I do not know the specifics for within a band as to which are set aside for this or that purpose. I intend to do so but haven't yet. So --- at this point I might trample on someone's territory and not realize it.

It would be nice if a cheat pamphlet were standard part of each ARRL renewal on a 3 year rotating basis to include the band plans. For those that do not join ARRL there is less band area for the Techs. to mess up with.

2320. Re: Can I use a power supply as a trickle-charger?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-25 00:00:00 UTC
From: "Christopher (Chris) W. Boone" <cboone@earthlink.net>
Message-ID: <34CB85BB.9D2E9A31@earthlink.net>
Source record: 180670

A trickle charger SHOULD be a constant voltage charger....that is
the VOLTAGE remains constant even when the load current changes..
Wall warts are NOT constant voltage by design...the voltage decreases
as the current drawn increases.....(simple resistor drop or
just a xmfr and rectifier...no voltage control)
To keep a wet cell from overcharging (or boiling dry), the charger
should be well regulated....a 12V PS can be used if it meets such
regulation requirments....With the battery fully charged (and a fully
charged wet cell battery for 12V DC uses 6 cells, each capable of
2.2 Volts), the voltage should be about 13 volts. Set the power supply
at 13.0 Volts (not 13.8!) if it has a diode protected output (a diode
in the power supply that will not allow the battery to discharge
back thru the supply if the AC goes off)...If the supply does
not have such a diode, you need to install one inline on the supply
output feeding the battery and radio...it MUST be capable of
handling the MAX current required by the battery OR the radio which
ever is highest....then set voltage on the BATTERY side of the diode
for 13.2, attach battery and radio.....(when battery is fully charged,
and radio is not turned on, the supply should show ZERO amp current
draw)

Brian: Please enter the following in the "for-what-its-worth" department.

I would avoid using any aid that utilizes plain text or QSO's. I would recommend a program that provides 5-letter code groups for receive practice. I have a small code program that is an excellent CW practice program. I believe that it is freeware or shareware. Great program for IBM-compatible! I can email as an attachment if you want it.

Try to learn the code as composite sounds. Do NOT learn the letters as numeric combinations of dits and dahs. For example, "V" is not three dits followed by a dash. It is the sound of these elements together that make a morse character. [An analogy: The word "car" is not the individual sounds of the "C" and the "AR. Rather, "car" is the sum of the individual sounds.]

The advent of electronic keyers has virtually destroyed the personality of CW'ers. Code is a language based on rhythm -- with prescribed timing intervals between the code elements. It is the variations of the timing that created the distinct "fist" of an individual.

Keyers allow people to send faster than they receive..... a no-no as far as I'm concerned. [The reason you can send faster than you can receive is because you KNOW what the next letter is when sending. You do not know what the next letter is when receiving.... so it creates lag-time between hearing, recognizing, and writing.]

To emphasize the rhythm we used to practice sending the following:

HLDL HLDR

BENS BEST BENT WIRE

When sent with a straight key or a "bug", you could OVER-emphasize the timing so that it sounded like a little ditty. Even using a keyer, it *might* be helpful.

Another tip: If you have access to CW practice media but it goes only as fast as you can comfortably copy -- you can still use the media. Let's say that you can copy 5 WPM comfortably, but your tapes (etc) are only 5 WPM tapes. Try copying the CW -- but circle every letter!

Hope this helps. Let me know if I can help you with the code.

Having been a ham since 1980 and coming from 11 meters as I did I am amazed at how 11 meters is looked at by most HAMS. There are good operators on both services. I operate the same on 75 as I do on 11 meters. I do not engage in practices that I would be reticent to allow my children to hear. It's ridiculous to say that all cb channels are operated by cb lids. A lid is a lid.

BTW, with all of the worry regarding new ham recruits, does not everyone realize that 11 meters is probably the most fertile grounds for ham recruits?

Tim, that is rubbish. One can hear that on almost any amatuer band.
Certainly it is common on 20 meters and 10 when it gets crowded during
sun spot cycle peaks. BTW, listened to 2 meters lately?

I mean no disrespect but the bottom line here is that it happens
everywhere, it's not limited to any one band.

I personally think that it's a general society phenom. 20 years ago
even 11 meters was much more pleasant to listen to and the HAM bands,
even 75 meters, were almost totally devoid of vulgar operating
practices.

So when did the editors of those magazines vote and pass the
changes needed? Seems to me MD misses the reality of the
situation in that it was the FCC that made the change happen
and no one else. The FCC might have relied on input from ARRL and
others, but in the end, the decision was that of the FCC and no one
else. Ine can speculate as to what swayed the FCC's decision, but
there's clearly no specific FCC documentation that explain it in
detail to say that the reason is as MD states here. In fact, the
ITU had already eliminated code requirements prior to that for
frequencies above 30MHz. That being the case, it seems all
the FCC did was bring USA requirements into agreement with
ITU requirements.

>Fast forward a decade, and now, when the codeless tech license has been an
>abject failure with its goals (yes, it has brought a lot of people into
>ham radio, but it hasn't fulfilled any of the goals it as promised to) we
>have the No-Code Agenda pushing for a codeless HF license.

Seems that if there wasn't a codeless tech license we'd have far
less hams than we do now. Additionally, I recall no one saying
we'd have hoardes of high tech types coming in. We never

had that. We did have a good percent of technical people
and we still do... but we sure don't get the same input anymore.
That's more a problem (IMO) with a code requirement today than
with nocode.

>Back in the 80's, there was a lot of skepticism regarding the codeless
>VHF license, and most of those who opposed it did so because they
>realized two things: 1) it was a dead-end license for people -- once
>licensed, they have nowhere to go;

Hey Mike, in other posts you say people are upgrading which
is why there are more extras today than a year ago. Which is it.

>2) Shortly thereafter, they knew the
>No-Coders would be back demanding Codeless HF access.

Once again, MD tries to taint the nocode TEST group by
ignoring that many of us ARE coded hams with higher than
tech licenses.

>The No-Code Agenda is very insidious, and similar to that used by other
>radical groups like Handgun Control, Inc. The goal of this latter is to ban
>all guns -- but, they know such an idea is too radical, and would never be
>supported, so instead they take the "baby steps" approach -- ban a few
>guns at a time, and before you know it -- whooosh! All guns are banned.

Bure unadulterated trash. MD wants you to believe that the
nocode TEST group wants to BAN CW. That is bull and
he knows it. There hasn't been a single post from anyone that
would even appear to want that.

>The No-Code Agenda has adopted a similar, albeit shortened, strategy. First
>they went after VHF, and once they got that, they turned their heads to HF.
>Never mind that all the promises of the codeless VHF license were a bunch
>of bunk.

Mike, I promised you nothing. You have a problem with someone
specific, then take it up with them... be it the ARRL or any
individual. The reality is that neither I nor anyone else posting
here in support of ending code testing has promised MD or
anyone else anything as regards the nocode tech license.

>The codeless license was supposed to be a panacea for VHF operation.
>The vast majority of technical experimentation -- high data rate thruput,
>spread spectrum voice, etc. -- all require large amounts of bandwidth which
>exist on VHF and *not* on HF.

So what.

>If "technical experimentation" is your goal, then VHF is your destination.
>And, we *already* have a license, without any code requirement, to let you
>get on there in as little as 5 to 7 days (take the test on Monday, and you
>can virtually have your license via the Internet in 5 days) and start
>experimenting. All this, mind you, with a theory exam that is predominently

>rules/regs, has very little electronics theory, yet gives you the capacity to
>fry your own brain. How much easier can it get? How much easier do you want
>it?

MD again ignores that most of us have asked for and
pushed for more rigorous testing of theory/regs for ALL
license levels. MD also ignors again the large expansion
of the Novice and Tech question pools in July of 97.

>On the other hand, there is very little technical experimentation which
>occurs on HF (sure, some will try and concoct some ludicrous story to
>cover their real motives, but even if you accept their story as true, they
>[the HF experimenters] are in a vast minority compared to the type of
>technical experimentation that would/should occur on the VHF bands.)
>The *ONLY* rationale for a codeless HF license is to quickly and easily
>give people access to HF phone, so they can get on the radio and start
>calling SSSSSEEEEEEEAAAAA-CCCCCCCUUUUUUEEEEEEE DDDDDEEEEEEEEE-XXXXXXX!

You mean like all the other HF coded hams do today? Then
what's your point. Indeed, what's the need for HF at all by
anyone if only for recreational use.

>The No-Code Agenda is a lie, just as it was in the mid 80's. And, its our
>duty to stop it.

Your duty MD, sure as hell not mine. Frankly, your passion in
that statement is truly interesting. What will you do when the
change does happen?

>>and extreme resistance to changes that threaten/affect the useless
>>traditions of the supposedly "elite" licensees of the Amateur Radio service do
>>more to suffocate and depress Amateur Radio than anything else. What else do
>>you need?

>There is no resistance to change in amateur radio. Amateur radio is many
>things to many people. Some like EME, some like CW.

To bad MD doesn't believe what he writes in terms of appropriate
test requirements. Ending CW testing would in NO way change
the above statement. If someone wanted to operate CW, then
they'd learn enough CW to get started and just do it. What's the
fear here? What's wrong with two hams having a CW QSO
at any speed, even 1wpm if they want. If they like it they'll
use it and get better, if not they'll move just use other modes.

>However, we are a
>nation of laws. Amateur radio has a series of regulations to follow, and
>some of those deal with licensing requirements. Fulfill the requirements
>and get a license. Its that easy.

MD would have you believe that the nocode test group is
encouraging the breaking of law. NOT TRUE. We want
to CHANGE the law as is OUR right AND that is what

we intend to do. BUT, until that change comes about, then I (we) absolutely recognize that a CW test must be passed to gain HF access. Many of us have done just that.

I suggest the phone would only be line of sight if the door was opened and the phone user hung outside for the duration of the call.

The aircraft fuselage is a very good radio screen. Very small windows.

Passengers may break rules and attempt to make phone calls but do they ever succeed?

Reg.

I got a very clean used TS-50 along with the matching autotuner for
use at an old family farm home that I visit from time to time. The
TS-50 and the autotuner are each the size of a cigar box. I assemble
the station on my arrival and disassemble it when I leave. Takes 5
minutes, tops. Leave the equipment in a closet when I am not there,
taking up virtually no space, but could just as easily take it home
with me. Use it with a multi-band coax fed windom.

Great portable station.

Welcome to the ACS Newsletter, developed by the ACS Training Unit of the State of California Governor's Office of Emergency Services. Please visit our ACS Home Page at http://acs.oes.ca.gov

The purpose of this weekly newsletter is to bring those of us in emergency communications closer together by sharing common ideas, and by introducing new technology into the emergency services community. All individuals with an interest in emergency communications, disaster preparedness or helping the community at large are encouraged to participate here in an open forum.

You will find a virtual community here with representatives from many different organizations with the same common goal: emergency response. We encourage everyone, from whatever organization you represent (or just yourself!) to bring us your ideas, suggestions, concerns, manuals, handbooks, or opinions so that we may share them with the group. To those of you who have just joined us, welcome aboard! Newsletter Subscribers: <534>

.....

>From the Editor's Desk:
We said goodbye today to a dear friend and responder, Cheyenne Starr from Morgan Hill, California. For those of you who didn't have a chance to work with Cheyenne, she was an emergency services volunteer dynamo. If you were involved in ARES/RACES/ACS/GMRS/REACT or the South County Disaster Preparedness Project in Santa Clara County, chances would be pretty good that you'd see Cheyenne there. She died way too soon from complications of diabetes and heart diease on the 20th at 55 years of age. She leaves a big void in Santa Clara County's emergency services volunteer network. This Newsletter is dedicated to Cheyenne's work and her memory; she's gonna be missed.
.....

>From the mailbag:
From: "David K. Z. Harris" <zonker@Synopsys.COM>

Hi David,
I think you have been given some information from last year,
but I thought I'd take the chance to spread the word again, since
we're beginning to recruit HAM volunteers for our annual field
communications exercise.

The Baker to Vegas Challenge Cup Relay (B2V) is an annual event.
Up to 200 teams, of 22 runners each, participate in a 20-stage foot
relay race from Baker, CA (Death Valley desert), over the mountains
to Las Vegas, NV. The event is for Law Enforcement-related teams

only, and the event has an international draw. (Watching the two Follow Vans for Team Calgary (CA, RCMP), with their three large flags flying in the early dawn light was awesome! L.A.P.D. S.W.A.T. runners run their legs in full turnout gear and boots!) The Official website for the event itself is located at

http://www.aol.com/~bakervegas

As a Ham field communications exercise, a core group from the San Francisco Bay Area organizes an effort to support some of the 'local' teams going to B2V. We set up a voice and data network that covers 2400 square miles, and equip ~20 vehicles with voice capability, and GPS (APRS) tracking capability. We stand a Closed Net, simplex networks, monitor the race emergency channels, and provide for shift operations. We arrange a convoy from the Bay Area to Las Vegas, and later to return to the Bay Area. We track volunteers that drive or fly separate form the caravan. And we have been at this for more than 8 years, while the APRS is only in its fourth year. (If you find an old AEA catalog, look for the PK-12 TNC ad, and the "Death Valley Tested!" insert . . . that was our group. :-)

This year, we will be supporting Fremont P.D., Union City P.D., and the Alameda County S.O., as well as consulting to a small number of other teams.

Because we need to rely on a lot of loaned equipment, and need to integrate it at the 'last minute', we have developed a Radio/TNC interconnect scheme which basically means that you make a cable for your Radio and for your TNC (which meet the specs on our web pages; http://baker-to-vegas.org/overview.html). This way, if we have a problem in the field, we can easily swap a radio or TNC out for a 'hot spare'. The other advantage for the folks that make use of the cabling spec is that it becomes very easy for folks to field TNCs for ARES events. We also label EVERYTHING so that folks get the loaned gear back, but as the storms move in this winter, the labels have made it easier for folks to loan gear to affected cities, and then get their gear back later! :-)

We've also developed a model for folks to use to set up a radio and TNC for home use, which can be quickly converted to an APRS tracker package. (http://baker-to-vegas.org/aprspkg.html)

As the ARES training officer (Assistant Section Emergency Coordinator for Training) for the ARRL East Bay Section, I feel this is the best event an emergency communicator can take part in, because it is the best simulation of a RACES activation. Except for the part about being able to schedule this months in advance, we use this effort to put on training classes, and then the group is 'activated' to go to a staging area (Las Vegas). A caravan, with travel frequencies is run. You bring your "grab and go" gear, and supplies for a few days away from home. You

sleep in a motel, some folks need to car-camp at field locations,
you are assigned a shift with position and tasks, you take part
in open and closed nets, and you are MILES from the closest
Radio Shack store! (If you didn't bring it, you do without.
If you can't repair it, you do without. This is the Practical
Exam for the training classes. ;-) On the plus side, AES has
a walk-in store in Las Vegas, which looks much like a Ham Radio
Outlet store, if you are interested.

One quick clarification regarding costs: we fund our own expenses
for this trip. We have no funds for hotels or travel. We do not get
reimburssed by the agencies we serve. We do have a block of reserved
rooms at the Circus-Circus, which is a mid-range-cost hotel, but
our volunteers may stay wherever they choose. (Yes, the volunteers
pay their own way, and many of them are returning, year after year,
for the experiences. :-)

There are two things that I promise the folks that volunteer;
1) You *WILL* learn something new, regardless of your experience level
2) You will wind up with your own personal story from this event.
(You can hear stories about, and from others, but you will also have
a story of your own to tell by the end of the event.)

If you are interested in finding out more about our efforts
for 1998, or participating, you can check our website at

http://baker-to-vegas.org

The best email address to reach me is n6uow@baker-to-vegas.org
Questions about volunteering should go to staffing@baker-to-vegas.org
.....

Current Events:
Dave,
Would you be able to put the following information in the "ACS
Newsletter" for the next several Saturdays re: Winterfest 98' in
Monterey, sponsored by the Naval Postgraduate School Amateur Radio Club:

WINTERFEST 98'
February 21, 1998 (Saturday) 8:00 AM - 1:30 PM
National Guard Armory (behind Monterey Peninsula College)
Monterey, California

FREE Public Service Event

ALL facets of Amateur Radio will be represented and demonstrated!

Spread Spectrum Satellite
Voice & CW Packet
ATV APRS
MARS ARES

Hopefully we will also have several "static" displays:

Red Cross Van (ERV) Santa Cruz ARES Van

The California Department Of Forestry and Fire Prevention
Volunteers in Prevention (Amateur Radio
Comunications), will also be represented and will have
pamphlets on the program, as well as, registration applications.

The Web Page: www.mcktech.com/wf98.htm

On the Web page there are futher details on Winterfesr 98' and many
other 'sites', connected to 'ham' radio. There is also a map on how to
get to the college and specifically the National Guard Armory!

73's
Bob / N6IBO
Salinas Valley Emergency Corrdinator
Monterey County Office of Emergency Services
ARES / RACES Liaison

Oakland, Calif., January 23, 1998 - The Federal Emergency Management
Agency (FEMA) today designated Oakland a "disaster resistant" community.
This designation is part of Project Impact, a national effort to change
the way America deals with disasters, shifting the focus of emergency
management from responding to disasters to initiating action prior to
disasters to reduce potential damage.

"We've got to change the way we deal with disasters. We have to better
prepare for disasters that we know are coming," said FEMA Director James
Lee Witt. "In Oakland, a local partnership of government, businesses and
private citizens is forming to reduce the costs and consequences of
disasters. This type of activity is my number one priority."

The Oakland community has already formed a collaborative partnership to
ensure that Safety And Future Empowerment (SAFE) through loss reduction
measures can help counter the effects of future disasters. This
initiative is called Partnership for a SAFE Oakland (Project SAFE).

"This exciting partnership complements the City of Oakland's goals in
which public safety is a top priority," said Oakland Mayor Elihu Harris.
"Project SAFE is the beginning of a vital program to further ensure that
businesses and the community will be better prepared to respond and
recover from major emergencies."

Under the terms of the memorandum of agreement signed today, Project
Impact/Project SAFE partners will undertake activities such as hazard
analysis, risk assessment and establishing a home/business strengthening
program. In addition, the City's utilities and infrastructure will be
subject to a comprehensive study to determine their vulnerability to
storms; the highest priorities identified in the study will be
implemented.

Some of the Project Impact/Project Safe partners include FEMA, the State
of California and the City of Oakland, Chevron, EQE International, Inc.,
Washington Mutual, the American Red Cross Bay Area, the Oakland Municipal

Chamber of Commerce and the Collaborating Agencies Responding to Disasters (the CARD Project), a nonprofit organization representing 18 Oakland organizations.

Project Impact/Project Safe partners agreed to a series of steps to mitigate damage to their facilities, to provide emergency training and special services to aid employees and to provide technical assistance, financial resources or in-kind services to compliment other members of the community.

Under Project Impact, six other pilot communities - Allegany County, Md.; Deerfield Beach, Fla.; Pascagoula, Miss.; Seattle, Wash.; Tucker and Randolph counties, W.Va. and Wilmington, N.C. -- have also been selected to demonstrate the economic benefits of pre-disaster mitigation to state and local governments, businesses and individuals. A Project Impact guidebook developed by FEMA offers a formula communities can follow to become "disaster resistant." --FEMA

APCO Institute will be conducting a Telecommunicator Instructor Course in Glendale Heights, Illinois on March 16-20, 1998. The cost for this course is $329. It is hosted by DuPage Public Safety Communications (DU-COMM), Mr. Richard Bauer at 630-260-7500.
For more information or registration information, call APCO Institute at 888-272-6911, or email to institute@apcointl.org. You can also check out the APCO International website at www.apcointl.org

This week's EMCOMM Bulletin:

EMC116 Radio and Money For release 1/26/98

One of the driving forces in today's government is what is best described as "bottom-line management", meaning the lowest cost of operations.

It certainly seems justified to eliminate any system that cannot be really justified in view of the short budgets most governments face today.

For some, today's wired systems put the need for radio in the background, especially if the manager considers radio an old fashioned system. Viola, to that person radio is no longer a justified expenditure; or it is so far down the list that the radio system is starved for funds.

In many cases it is hard to make a case for the funds for a radio where there has been no essentially required utilization of that system for a period of years. If it is not used, then why fund it is a logical argument.

Logic is the basis upon which the bottom-dollar concept rests. Yet, there is more than logic involved in the field of emergency management - there is the matter of what is best for the citizens that the jurisdiction serves. What is best often is _not_ a bottom-dollar decision. It may, in fact, be just the opposite. For a community that has never had an earthquake, yet which faces a 35% chance that a severe one may occur in the next decade which view should prevail? (1) It's never happened and it's not bottom-dollar effective to put money into any system that is earthquake related. Or (2) In the interests of protecting the jurisdictions ability to effectively respond _should_ an earthquake occur, we need to provide for a suitable radio system.

Radio? Yes, radio! Why? Because radio provides WHAT NO OTHER SYSTEM CAN OFFER - diversity, instant recovery, total deployability, single sender/multiple receiver communications, instant expandability to overcome heavy congestion. There are countless instances each year where radio is the essential tool required for the restoration of normal communications following an emergency. The fact that it may not have occurred in your jurisdiction for the past 15 to 25 years does not mean it won't this year!

The radio to which I refer is _more than_ government's own Public Safety systems. It also includes the Auxiliary Communications Service (ACS) - an emergency communications unit that is a part of the local jurisdiction. The ACS is comprised of FCC Amateur Radio Service licensees and others with valuable skills in communications. The availability of the Amateur Radio frequencies in an emergency is an extremely valuable asset any government is well advised to cultivate to the utmost. How to do that is another subject. Here the purpose is to remind all managers that the ACS and similar type units are an asset far too valuable to let bottom-dollar actions jeopardize.

ACS Web page: http://acs.oes.ca.gov FTP archive: ftp.ucsd.edu/hamradio/packet/tcpip/incoming for new bulletins and ftp.ucsd.edu/hamradio/races for earlier ones.
Landline BBS: 916-262-0856 (graphical & standard interface).

I suppose this is your idea of "rec.radio.amature.misc" ?

I suppose you liked the economy during the Bush and
Ray-guns time... when everything was deregulated and
the folks... like George's son were able to float worthless
stocks and sell them to elderly people that wound up without
any savings. Now talk about morals....

I would look for a reply from you, but your type of closed
mind will only have one avenue to wander down.

Smoking gun... hah hah.. ha ha ha ha... and Nixon was
your kinda guy right?

Hello. I recently bought an AR-146, and I''ve found out that on medium power, it puts out 10W. The problem is I'm getting 10W out on high power, too. The display goes up more on high power, showing its putting out more, but the meters prove its still putting out 10W. Does anyone know what the possible cause maybe? The power supply is a car battery, so it has plenty of power. Is the power output adjustable internally? Thanks a lot for any help.

PHILIPS Model 477 Belt-Drive Manual Turntable. Nice addition to any stereo system.

Have 3 photos in .jpg format to email if you're interested for your review

Has unique feature of built-in constant monitoring tracking gram weight scale in the table for continual measurement of tone arm tracking weight to protect your diamond needle & cartridge.

Other Standard Features:
- Tone Arm tracking weight adjustment
- Anti-skate adjustment
- Cueing lever
- Tone arm height adjustment
- 33/45 RPM
- Straight tone arm design
- Nice Physical Shape with Smoked Lucite dust cover and silver base.

Unit needs a cartridge as one side is not playing and humming with present cartridge. A basic functional Shure cartridge can be had at Radio Shack for $20.

Also needs a new "U" clip put on the ground wire for the table as the present one is missing. A matter of simply pressing on a new one with a pliers and about 25 cents for the part.

$80 or best offer, plus shipping cost.
Will pack it free.

ALSO WILL CONSIDER SWAP FOR CIVILIAN OR MILITARY TUBE TESTER

International buyer welcome.

2350. "5wpm is NO CODE!?!??!?" :-(

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-25 00:00:00 UTC
From: gdfthr768@aol.com
Message-ID: <19980125054901.AAA29814@ladder01.news.aol.com>
Source record: 180721

Jim Kehler wrote, in a past posting:
"...And remember... 5wpm is NO CODE...."
Now, I'm just starting to learn the code because I love SWLing/CBing, and want to get on HF. I want, like most of you, to talk in voice or CW and go around the world making friends and great DX "hits". So I WILL learn the damn code, because "dem's da rules" right now, and because I love radio.
But my problem with Jim's statement (and I'm sure he's a good fella) is that I have to learn in steps, and if I can get myself to 5wpm you can be damn sure that I WON'T think of it as NO CODE! I hope to hell that most hams do NOT think of 5wpm as no code. If that's how newcomers are looked upon, it's a shame.
It won't scare me away at all, I'm a big kid and can fight 'till I'm accepted, and I'm sure I won't have to fight at all, except to heighten my code/operating skills. But doesn't that statement make anyone else a little uneasy?
We ALL operate at different levels, particularly when learning, and educating one's self is even more touch and go than schooled discipline. So why is "first grade" seen as a joke? We ALL were in first grade once. Give the new guys and gals a break, please. On my way to 13wpm, and 25wpm, and even more, I will at some point only be as good as 5wpm. On my way to knowing all about RTTY and Packet and how to build my own SSB 20m. rig, I will at some point only know that capacitance is measured in farads and resistance in ohms. Who wants to laugh at a guy trying to learn?
I'll laugh all the way to Extra Class, I can assure you. :-)
My opinion only,
Mike in MO.

Well we should reserve judgement until the truth comes out, BUT it
sure looks like we are in the last days of Bill Clinton.
How ironic that the woman this mess is centered on now lives in the
WATERGATE hotel.

We need to look very carefully at the words Clinton uses when he
denies the alleged affair and possible coverup. I believe he said
something to the effect that there was "no sexual relationship" and
that he "asked no one to lie".

He might not have believed that he was in a "relationship" ... maybe
he was just having sex or his sex needs satisfied? We know that to him
(via the Arkansas state trooper) that oral sex to him is not wrong.

Therefore to him a "sexual" relationship would not exist if they only did oral sex. He never said that he did NOT have any sexual acts or intimate contact with her.

On the possible lying part, he may not have asked her to lie. But we do know from the Clinton tapes with G. Flowers that he did tell Flowers that they could deny their affair as long as there was no evidence. So he may have simply told Monica that as long as there was no evidence or witnesses that she might consider not mentioning it. Remember he said that he "did not ask anyone to lie" ... he may just have mentioned it or talked about it in a round about way. Therefore his statement to the press would be technically correct. Plus he was not under oath when he made the statement to the press.

I used the Gordon West tapes to learn the code, and the ARRL ones to get up to about 15wpm. The ARRL ones have a lot of really silly sentences with long words, that make it hard for you to guess what is coming next. They also have some almost random runs that were really hard for me to copy, but they helped out a lot.

If you use a computer program, don't just listen to the QSO's. I did this and got lazy, and would just listen for the words that were randomly chosen. Try something like the words spelled backwards option (on Super Morse, other programs probably have something similar.), or classified ads you've entered (if you can enter text to be sent). If you do this, listening to a QSO when you take the test will be much easier.

Good luck,
Brian

Also, stay away from a key. You CAN NOT send better than you copy. Learn to copy first. And, don't forget, sandbag Novice bands, that'll give you practive in protocol, listening through QSB,QRN, and QRM Plus you'll get to know some of the guys before you get on the air, and know where they hang out. Pick slow ones at first, then as you get better push yourself to copy faster fists. Also, monitor the W1AW code practive sessions, listed monthly in QST. Fridays are good once you get up to 18 wpm, because of the news, solar flux reports, and contest news. Mainly, relax and enjoy yourself, each time you pick up a new letter, word, or phrase you will smile with a genuine sense of accomplishment. The program Super morse is good. Personally, I found the tapes boring, and easily memorized. Also, you get used to hearing 1 fist and one set of conditions, which is not the real world. On your way to work, whistle or sing the code as you read roadsigns. Start thinking in code. You'll really be surprised how fast you pick it up. All it takes is. . . are you ready for this?. .. . . . practice. Nobody is born with the code in their head. All these thousands of operators have learned it one letter at a time. It may take a week or two, maybe longer for some, but when you get done, and you can copy 10 to 20 wpm, you will be in a group of people that didn't sit on their hands and whine "I can't", you'll be in the group that DID. Nothing ventured nothing gained. Anybody can whine and plead for mercy and sell themselves short. A few get up and get on the ball and try to learn something new. It forestalls senility to learn you know. And, after all, isn't amateur radio a hobby?? Shouldn't it be challenging?? Who, and what kind of character would such a person have, would want to join a hobby that offers NO challenges and no sense of accomplishment????

>early as 1915.

De Forest patented the triode in 1906. But the first CW stations used alternators because early vacuum tubes weren't capable of the power levels needed. Armstrong invented the regenerative receiver in 1912, the same year Pickard invented the crystal detector. Prior to 1912, most receivers used coherers, bolometers, or electrolytic detectors, though Fleming's diode valve was available.

But I'm curious how SSB was generated without a CW LO and how it was translated back to baseband without a CW LO in 1915. That doesn't seem possible, the generator equations require a coherent source. And alternators and vacuum tubes were both available in 1915 to supply one.

Of course wireless voice transmission pre-dates use of Morse by wireless. Nathan B. Stubblefield was transmitting voice in 1873 and performed a demonstration before Congress in hopes of getting funding to deploy the system for the Navy. He was asking for $30,000, but he didn't get it, even though he successfully demonstrated wireless voice transmission between a shore station and a ship on the Potomac over a distance of 5 miles. Ironically, this was the same year Hertz was doing his experiments with UHF signals that got him official credit for the discovery of radio waves.

Insofar as an upgrade to the CPU goes, I think you may have heard about the CPU clock speed being a bit on the fast side. I had a problem getting into my own UHF repeater with the VX-1R. The problem appeared to be the P.L. encoder in the radio. Well it turned out to be a bit of both. I ended up removing and replacing the tone reed in the repeater as it was hearing a little low, and the VX-1R was encoding a little high. I talked with one of the engineers at Yaesu, and he pulled a couple off the ass'y line and told me they had the same problem. Solution to my problem was to send rig back and get adjustment.

The best explaination I have heard was that if "lid" was not sent
properly in landline (American Morse) code, it sounded like "dd":

daaah, dit dit, dah dit dit. (daaah = long dash)

It was a basic test of a proficient operator.

I think the real issue between all the discussion in amateur radio today is whether or not the old guard is ready to relinquish control to the new, in this case, our huge and ever growing list of new Codeless Technicians. And there is no question that they are not ready to do such a thing. The recent ruling to not change the licensing is one example. The magazines are another, the biggest one just continuing with the status quo, not wishing to change a thing, as long as it can continue to make a fortune selling its publications. I think the time will come when the majority will break off on its own and leave the old guard to die, which many have already. So welcome the new, and the change!

Cheers!

Joe

There are 33% MORE than that in the US alone.

>there _should_ be 5 x that amount.

Why should there be? By what statistical calculation do you infer that
2.5 million amateurs is the number that "should" exist?

>Having to learn an outdated
>protocol, ie morse code, to advance beyond "tech" is silly, and is certainly
>contributing to the problem. What's the point of having to learn morse?

There are numerous legitimate reasons for learning morse code, and retaining
it as a test element. Your question would require reiteration of the entire
rec.radio.amateur.policy newsgroup. I recommend you read that newsgroup, and
spend some time on the DejaNews archives to properly educate yourself with
both sides of the argument, rather than just re-hash old topics.

> Do you ever become frustrated because of the
> ridiculously high prices on most amateur radios?

Nope. I own every piece of equipment I have wanted to purchase. What I
don't purchase, I build. I've never built an HF radio, its easier to buy
one.

>It would seem to me, if there were _more_ demand the prices would perhaps
>"moderate"?

Not necessarily. Price is determined by two factors: supply, and demand.
Demand is low, supply is low, thus prices are high. Prices could drop if
supply increased. Increasing demand without increasing supply would
merely cause prices to skyrocket.

> True, but show me some figures that indicate how many are still active.

An impossible statistic to show. The next ten years will show more as
people do not renew their licenses and some of the over-inflated
numbers we have now in terms of licensees starts to decrease.

> I don't think so..it's time for some progressive thinking in the "ham
>ranks"..dump the "old farts"..and narrow minded "bureaucrats"!

At 33, I wouldn't consider myself either an old fart nor a bureaucrat.

>demand the prices would perhaps "moderate"?

There are few compelling reasons to require knowledge of Morse Code for the average VHFer or higher. CW is the mode of choice for most of the more exotic modes such as EME, Aurora, meteor trail, etc propogation, but no, I see no reason why a ham needs to know the code to operate above HF. Under 30, and especially under 28 MHz, the situation changes. There is only just so much spectrum available. 30 CW QSOs can co-exist within the bandwidth of a single SSB QSO. Power requirements are more modest, thereby further reducing QRM. The average Tech can build a transmitter for HF CW for just a few bucks. Keeping the CW bands for CW (and other data modes) allows the most users on the bands withthe least power and the smallest minimum expenditure of money.

As for your second remark, if store-bought rigs are too expensive, do what I did for my first rig... build a transmitter and modify a cheap SW Receiver, put up a wire antenna and get on the air. Since I already had the receiver, the wire was free, and the coax, I figure I was on the air on 40 and 15 meters for a total cost of well under $50.

True, I use an all-band all-mode solid state wonderbox now, but really, I think it was just as much fun with two transistors and a hacksaw-blade key.

hmm... I still got the key...

Digital pentrates better, and even Morse can be better sent by machine
than by people, thus even the uses for morse dont seem to justify
learning it by hand.

You're saying the dumber the dog, the easier he is to train. Any kid
who grew up around animals knows better than that.

I see that you have no problems at all in fitting the "facts" to the
No-Code Agenda, Gary. Too bad that you, as I, got stuck in the Incentive
Licensing 'debacle' of 1968, lost lots of frequency privileges, and were
'forced' to upgrade-or remain forever bitter over it. It's very
apparent that you never got over it, like far too many others.
Yes, it was a poorly designed and implemented plan for improvement of
the ARS, surely there could have been a better path that would not have
left so many with so much bitterness.....but for some people it did work
to prompt them to learn and improve both their knowledge and their
license class, their amateur privileges, as well as job advancement.

Hmmmmmm.....Cecil, you got that? You said you had no trouble at all
learning CW as a kid, even did it well before you ever heard of ham
radio. Looks like Gary thinks you're pretty stupid!
Give back your MENSA card NOW! We promise not to tell INTEL.

Gary, you obviously have a non-existant CW vocabulary, only 26
letters, 10 numerals and a few prosigns. If it were otherwise, you'd
know better.

So??? Just because someone "wants" to become a
Amateur Radio operator, doesn't mean we have to
bend over backwards and and reduce the quality
of new, incoming hams because some can't meet
the requitements. The Amateur Radio hobby has
drastically taken a turn for the worse when the
FCC stopped giving exams and added the No-Code
Tech license. I would have loved to have been a
F-15 pilot, but I didn't meet the "requirements".
We shouldn't make the requirements any easier to
become a Amateur Radio operator just because a
bunch of people complain about the code! If they
don't want to learn the code, fine...they just
won't become Amateur Radio operators!

Walt.
CW FOREVER!

There is nothing "huge" nor "ever growing" about the codeless tech
license. Being that the first codeless tech licenses are not scheduled
to expire for another 3 years (2/2001), codeless tech numbers are
artifically inflated and do not represent the true number of currently
active licensees.

I personally use XMLOG.. Guess it is not as fancy as the high price
spreads but for FREE it does everything I want and more. Depends on
what you are looking for in a logging program but I would suggest you
take a look at this one. Available from
http://www.xmlog.com/
It runs under win95 just fine. I've been using it for almost 2 years now
and never a problem.

Good luck in your quest.

Actually, A cell phone doesn't work at any serious altitude. I operate aircraft at 35-45000 feet all the time. At about 3000, depending on location, a cellphone goes inop as it begins receiving to many data channels from multiple systems at the same time, and eventually the receiver just plain gets saturated with signals and data can't be decoded, the phone registers "No Service".
As for Computers, it is very possible that the "clock" in many computers (older ones) generate harmonics that fall in the communications and/or navigation spectrum of aircraft. Like a 12Mhz 286 puts out a lot of crap at 108.0, 120.0, and 132.0 MHZ. We have actually seen this happen at our offices that used to use 132.0 as our company unicom freq. The 12 Mhz old computers made the receiver useless as the dispatchers kept squelching the radio tighter and tighter to stop the "noise" I don't know all the possible harmonics problems associated with various computer clock speeds but they are the worst problem causers.

As for VHF and UHF ham radio and business radio,s. The single biggest reason for FAA denying their use is that in most cases, those in charge of the flight have no idea what is possibly harmful or not. They are not electronics experts, most don't even know why it is illegal. I have never heard of any report that these radios have ever caused a problem. I suppose it is possible that the oscillator or multiplier section may make a hit in the VHF Aviation Nav/Comm area, but I have never heard of it. I have heard CBers and Low Band pagers on occasion coming over the Comm channels, again crappy harmonic filtering. As for the Av radios being built with less than the latest technology, no receiver of any possible use today in aviation can "filter" harmfull interference when the interference is RF on the receivers receive frequency. Spread Spectrum, CDMA digital, maybe. But we are still waiting for NBFM.

I personally could not "Let someone" use a ham rig, but I wouldn't worry about it either. Used to be the Captain had the authority to "Allow" such use, but the Cellular boys and the FCC put an end to that, along with the advent of the notebook computer.

Bill, I'm not necessaraly defending the code form of immissions.
Personally I don't even use it anymore except to keep my "ear" in it. In
fact I was enjoying it until I had to get my speed up to pass my 20wpm.
I can't write that fast & it became frustrating to read my copy. I did
it
& somewhat proud & thankfull that I did. I guess what I'm saying is,
right now it's the law of the land & he or she who wants the privileges
must go through it. I don't have an answer to the restructuring needs,

but I can relate to the frustration of many new hams. I do encorage
those
who want to upgrade @ our VE sessions not to give up & help them with
study tactics. Good luck with youre endevoure.

Ah, but the issue here is zoning, not the reception, transmission, or other *operation* of a radio station. If you read PRB-1, the actual opinion, you will note the reference to free speech guarantees as applied to the display of flags, American or other. Interesting side effect here may be the preemption of local ordinances against religious and political signage on private land. How many of us have an obnoxious neighbor with John 3:16 signs in 5-foot-tall red lettering on their lawns?

>
> Unfortunately for your argument, federal law is held superior to state
> and local law. It is subservient only to treaties and the Constitution

the Constitution which devolves all authority not specifically retained by the Feds to the state or municipal level. So, though Starr is employed by the Federal government in this matter, he is still bound, as a citizen and an officer of the court to obey all laws, unless and until the Supremes strike it down. They have consistently deferred to the states in one-party/two-party cases; even under Rehnquist, they have upheld the stricter of the two where there has been conflict. There is no Federal standard per se on this issue. DC has its own standard, set by the Mayor and District Council. Intra-governmental is a matter of regulation, not law.

Yawn.

When you provide personal information into a public database (such as the
FCC database, 411 internet address database, etc.) you loose all expectations
of privacy. So the courts have ruled.

But, you get 1 point for a nice try in attempting to intimidate the
original poster.

>but then after removing the charging voltage the voltage drops to maybe around
>0.8V. Are these cells destined for the recycle bin?

Try leaving them connected to a constant voltage source of 2.30 V for several
days.

A good but discharged cell will immediately draw plenty of current
(about half their rated capacity in Ah) and then taper off as it reaches
full charge. The current will be almost nothing after 4 hours or so.

A cell that has been allowed to go dead in storage may have electrolyte
that has turned to water and sulfated plates. If you connect it to 2.3 V,
it will draw almost no current at first. But as you leave it, a little
bit of the sulfate will leave the plates and go back into the electrolyte.
This raises the conductivity of the electrolyte, and the charge current
increases - so the process continues at a higher rate.

I recently did this with a 12 V 7 Ah cell that was about 1.3 V open
circuit. At first, charging current was miniscule. After 3 hours,
it was up to 50 mA. After 13 hours, it had risen to 112 mA. 24
hours after starting, it was up to 360 mA. Charging current peaked at
about 430 mA about 30 hours after starting. Then it went back down
to 52 mA about 40 hours after starting.

At that point, I connected the battery to a load that draws about 2 A,
and got 2+ hours of output from the battery. This is most of what you'd
get from a new battery of this rating under that load.

Then I connected the battery to the power supply again. This time it
drew 2.8 A charging current (the maximum recommended) immediately, and
was almost fully recharged after 4 hours. So the battery seems to have
almost fully recovered, with some loss of capacity.

Well, there might not be a whole lot of people using CW, but it sure
sounds like a lot to me.
WHen I tune in on 20 meters, it sounds like everyone is using CW.
The signals are so close together that I can not single anyone of them
out.
The truth of the matter is that no-code HF has its advantages and its
disadvantages.
On one hand, people would not have to work as hard to earn HF
capabilities.
However, the whole band would be overloaded with all the voice signals
since the voice signals take up more band width than any CW signal.
If you're going to have no code HF, it should be on restricted
frequencies.
For example, a no code technician could have 10-meter repeater access on
29.5 and up.
Anywhere above that should require some code from my point of view. That
is just my personal view point.

I think you left out "no-code", otherwise I've no idea why you're
posting it to an amateur radio newsgroup.

[CVC 5005] (b) The department shall not issue more than
one set of special plates for any licensed amateur radio
station.

Subsection (b) evidently means that I get only one set
of call letter plates per lifetime . . . . I guess I
don't get a new set of plates until the old ones are
lost, stolen, or mutilated past recognition.

Or until/unless you change your call.

Actually, my impression of CVC 5005 is that if an amateur changes his call, he is required (or, at least, expected) to surrender any plates with his old call. Has anyone out there from California actually done this? Did the DMV let you keep the old plates (minus the registration sticker, of course) as souvenirs? What about hams in other states?

>1. Still wondering what center frequency is most common.
>Mark signals are (always?) on 1275. The space frequency depends on the
>shift of a signal.
>So how can you say that there is ONE center frequency?

On an FSK signal, the relationship between the RF frequency and what your decoder needs is arbitrary. The audio signal frequency comes from the difference in frequency between your BFO and the signal in the IF amplifier in the detector. Out there in the rest of the world, there's just a signal at one RF frequency or the other (and bunch of FM sideband stuff which is irrelevant for this discussion). And the center frequency would be the average.

>2. Also: isn't the mark frequency the actual frequency of a data
>station?

Not sure, there's probably an ITU or FCC definition for this. Looking at the FCC regs (Part 2.202, they define deviation as half the difference between the maximum and minimum frequencies, so it looks like center frequency, not mark frequency.

Also, you need to know how your receiver reads out the frequency. On my old Kenwood R-1000, it reads the center of the IF, and there a 1.4 - 1.6 kHz offset to the zero beat frequency when running in SSB mode. With receivers that have a higher resolution (than 1 kHz), you can have all sorts of choices, like displaying the BFO zero beat frequency (useful for SSB voice), or adding in a fixed offset to the BFO (useful for CW). And then you can screw yourself up by switching the BFO frequency to the other sideband to invert the signal instead of using an inversion in the decoder.

>3. I wonder when you use a decoder with a fixed center frequency along
>with a radio control program, you can tune the station 'in the middle'
>of the center frequency, just by tuning in via the database??

Garbage In, Garbage out. Depends on your database. Back when I was doing a lot of this, there were a lot of published loggings that were just the receiver readout, not taking all the frequency offsets into account. Spurious precision, but they got some number good to 100 Hz even if they were off by about 1 kHz.

For what it's worth, a group of Amateurs in the US has begun transmitting CW and RTTY on top of the intruders, using beams and/or high power. The illegals usually move off pretty quickly. I checked with the FCC Monitoring Station in Columbia, MD about this practice. They said it was not considered intentional interference by the Amateurs if the stations being jammed were not supposed to be there in the first place.

28.085 is a frequency getting a different type of attention. Some truckers "adopted" this as a "company channel". Because they concentrate at one spot on the dial, it has made it easy to track them and follow them into weigh stations, where the operator and the vehicle owner are identified. Letters to a few company presidents have made a significant dent in illegal operation on 28.085 in the past year.

This is passed along simply as encouragement about the situation. It is not intended to start a CB vs Ham arguement. Nor does this address freeband operation. Frankly, most Amateurs could care less what happens below 28.0, and most freeband operators respect the band edge.

You can write as much and as long as you want, Bill. Its an open forum. It just seems like you are "preaching to the choir." Even if you convince someone in the NG to adopt your position (which is not likely), what good would it have done for your cause?

As I understand your position, you want to spread your views to as wide an audience as possible. I respectfully suggest that this is like being a "shot gun" which scatters in a lot of directions, but which doesn't do much at a distance. If you want to be like a long range, accurate rifle, focus your writing efforts on those who can make a difference on the issue at hand---whether it's the CW requirements for Amateur Radio, or anything else.

Best regards,
Yrac

Who knows what will happen between now and when the first gate 2
vanity licenses come due for renewal. A lot can happen in the next
8+ years. Perhaps by then, they'll charge a stiff fee for the renewal
of ANY license and the vanity fee will be redundant. There is a good
chance that licensing will be entirely privatised by that time, the
implications of which with respect to fees is totally unknown. Perhaps
more than one organization will offer licensing so you could go with
one that offered the best deal.

DX-World-Guide 1998 by DJ9ZB

Now available!

10 Years after the first edition we proudly present

now the completly new edition of Franz Langner's, DJ9ZB,

DX-World-Guide. (English language!)

This A-4 sized book is a must for DXers, SWLs, expeditoners etc.

354 pages full of information with maps, QSLs, QSL-bureaus,

Information about IOTA-Nrs, WAZ, ITU-Zones, Grid-Squares,

UTC, Prefixes, ex-Prefixes, Radioclubs for each DXCC-country!

Also many information (Address, Tel., Fax) about licensing authorities.

Each DXCC Country is presented on one page.

Price: DM 30,- incl. p&p within Europe. (Euroceque or cash)

DM 40,- or USD 25,- incl. airmail Postage worldwide (cash only)

The book is available ONLY from the publisher:

DL8HCZ, Joe Kraft, Gruetzmuehlenweg 23, D-22339 Hamburg, Germany

For any further questions: FUNK-TELEGRAMM@t-online.de

Many greetings from Hamburg de Joe, DL8HCZ

Wow! Suddenly the "pro's" have come out of the woodwork, Jeff. I had just finished reading a post about autoalarms when I ran across YOUR message.

Probably some of us have worked each other. I might even recognize your "fist", HI. I was a USCG RM1 and served in the Gulf of Mexico on Campeche Patrols (NUZY), with a fellow named Glenn Mushett, from 1964 to 1966. I then transferred to Sand Island, Hawaii onboard the USCGC BERING STRAIT. If you've ever worked Ocean Station Victor/4YV, there's a good chance it was me! I was there almost constantly from 1966 to 1968, except for one year in Viet Nam as part of the US Navy. When ashore, I ran phone patches for the guys at sea, using KH6DED at Sand Island.

After leaving the USCG, I went to work for ITT as a CW operator at station KLC, near Galveston. I stayed there until 1978. Exciting job, and it paid well, too! I'm doing other things, now. But I sure miss 600 Meters! KLC had a 500 foot vertical tower, with 36 radials at the base. We also had several acres of HF antennas. A ham's dream station!

Just a "figment", you say? Well, son, it was an expensive imagination for a number of folks during 1997. Here's just ONE example:

"A man fined by the FCC for malicious interference and other rules violations has finally agreed to pay up. In 1996, the FCC fined Timothy Harold Hoffman of Phoenix $6,000 for repeated violations, including interference to Phoenix area repeaters. The violations were called to the Commission's attention by the Arizona Repeater Association's ARRL-sanctioned Local Interference Committee.

"Hoffman was cited for five specific violations, including transmitting on ham frequencies without a valid operator or station authorization, and willfully and maliciously interfering with ham radio communications. "
-----QST, February 1998, p.74

Note: The federal judgement was by US District Court judge Robert C. Broomfield.

>speculated on what it might do, they (the editors) owed no
>one any promise tht such end results would be guaranteed.

We're not talking just about editorials written by magazine editors.
We're also talking about letters sent to the editor (which were
roughly equalized by letters against removing the code, so there was
balance on the 'letters' pages), and we're also talking about other
sources.

Even today, we see the No-Code Agenda still claiming that removing the
code test for HF will bring hoardes of techno-geniuses into the hobby.
Why would it? It didn't when we eliminated the code for VHF. There is no
reason to think it would if we eliminated HF code.

>I have stated over and over again that, all that I
>see as the rational to end code testing is the simple fact that
>there is NO compelling reason anymore to retain it.

You just stated that bodies were important. Which is it?

>There absolutely no reason today to require all HF hams to know morse.

When you get right down to it, there is little reason to require 99%
of the knowledge we do. Most people use existing modes with store-bought
equipment and never build anything, except assembling their antennas.
Virtually the only knowledge required for HF operation these days is
a good grasp of the rules and regulations, and basic safety. I daresay that
a good 80+% of what is on the existing examinations could be eliminated
using this same exact rationale.

>So a couple of editors made such statements. Do they speak for all hams?

Go To Paragraph #1.

>I have first hand knowledge of competent technical people
>who would be good hams, but have no time to do the code
>requirement. That's sufficient evidence for me.

Why don't they get Tech licenses? That's what the license class is
there for.

>The tech license has always been somewhat that way, even before the codeless
>tech was created. I was a tech for about 30 years. Many others were also.

And why is that?

>Please find even one such example. Just who promised what?
>MD keeps saying that but I still see no such examples other
>than vague references to past QST editorials...as if the editor
>of QST had any power to fullfill such a promise.

I'll use the typical Carl Stevenson dodge here: "I don't have time to do
your research for you -- go back and look through your magazines in the
early-to-mid 1980's for plenty of examples".

>That sure says a lot about MDs attitude and willingness to effect any
>meaningful change rather than just bitch about the size and type of questions.

I'm sorry that you cannot see that the underlying system of examination is
broken. If you did, you would understand that increasing the question pools
is not the answer, but overhauling the entire examination system to
eliminate question pools *IS* the answer.

>>>To bad MD doesn't believe what he writes in terms of appropriate
>>>test requirements.
>
>>Bill Sohl ignores numerous postings from myself where I publically
>>state that I openly support "mode-based testing", where individuals are
>>only tested in those modes they wish to operate.

>nor ever likly to become a reality. Supporting that which has no
>probability of coming about is always easy.

I do support appropriate test requirements. Mode-based testing is by
far the "fairest" form of testing there is (since, after all, the No-Code
Agenda keeps yelling that requiring code-tests for HF access is "unfair"
when all they want to do is operate SSB, I fail to see how they could *NOT*
support what is, undoubtfully, the most fair form of testing there is --
only those modes each person wishes to personally operate.

Sometimes good change hurts. Some people say that mode-based testing is
"too hard". Where is it written that whenever a change is made to amateur
radio, the change always has to result in something being *easier*?

If the No-Code Agenda were really interested in things being "fair",
they would support the concept of mode-based testing. The fact that they
do not says volumes: either 1) they are hypocrites, or 2) they really
are not interested in "fairness", but simply yacking on SSB. Methinks #2.

^^^^^^^^

You missed out "or don't have the aptitude". There was a guy who posted here recently that he learned CW in a day. Good for him, kudos, etc. He must have a natural aptitude to learning codes. I, on the other hand, have been trying to learn the damn stuff for several years and am getting nowhere fast. It's intensely frustrating and pointless [1]. It reminds me of my old art teacher who used to say "just DRAW what you SEE!" - and try as I might, the squiggles that appeared on the paper looked absolutely nothing like what I was trying to draw.

: Curtis .. N5HDQ .. Rock solid with a pencil at 25 WPM ..

Good for you; CW as a mode has a lot going for it.

[1] As I just said, CW is great as a mode, but a poor choice for a test. I do believe that access to HF needs some sort of testing, but the powers that be seem to be saying "you have a free choice of modes to use on HF, but you have to be able to use CW, even if you don't want to / never actually will". Perhaps what we really need is a codeless HF _technical_exam_, and a CW test for access to those parts of the band set aside specifically for CW (and if they aren't in the schedule, they should be).

the guns are real!!!! the technology was discovered as early as ww2. when the atomic bomb was dropped in japan, it was noticed that the "emp" from the explosion blew out power in any thing electronic almost a 100 miles away from ground zero.
but, as with any new toy the government develops,other groups spend twice as much to defeat it. the result is alot of hipe "ie 700 club" and alot of money spent on nothing.
p.s. a friend who works for raytheon says the "emp" needed to blow your computer or 2way radio up from say a 100ft would make the user of the weapon sterol. the units the milatary uses are remotes mounted on the outside of a vehicle or aircraft, and would stick out like " a sore thumb" if someone was in your neighborhood with one.

Sorry to tell you that there is no Agenda -- have never seen it published
and have never agreed to it. I think if you were to poll all the
"no-code-test" people, you would find that they are not involved in any
concerted effort beyond the minimum, i.e., changing the code test
requirements for HF access.

So if you DO find an agenda, it is not the "get rid of all cw forever"-type
movement you ascribe to it.

This is a misuse of the term "agenda". There is no plan of action. Now if
you mean to say that the logic used to promote the no-code license can be
extended to promote the elimination of all code use, you may indeed say
so -- but there is no agenda "we" are following. Still sounds like you're
believing in conspiracies <grin>!

>1. First you cannot ask her to stop using the cordless phone.

If he were in the US he could. Part 15 devices must not cause interference
to other services. I don't know if Canada has a similar requirement, but I
suspect that it does.

>2.Hearing the cordless around 147 MHz, is a ghost image usually 2 time
>the IF frequency of your scanner

That would put the phone at 125.6 MHz, right smack in the middle of the
aeronautical band. If that were the case, then it definitely must cease
operation. Or it would put it at 168.4 MHz, where cordless phones also
are prohibited. And besides, the HTX202 has the best front end filtering
of any amateur HT, and certainly would not be giving an image response
to either of those frequencies even if the cordless phone were permitted
to operate on them, which it isn't.

What is almost certainly happening is that the 49 MHz cordless phone
is producing a strong 3rd harmonic, which convienently falls on 147 MHz.
This is, of course, illegal behavior on the part of the phone, and there is
nothing to be done to the amateur radio to prevent it from receiving these
spurious emissions since they are right smack in the middle of its legitimate
bandpass. The phone needs to be repaired or replaced.

>3. tough luck

It is tough luck because the authorities aren't very interested in enforcing
their own spurious emissions regulations anymore and are unlikely to take
the proper action to shut this illegally operating cordless phone down. But
the fault does lie with the phone owner, and the legal burden to solve the

problem is on the phone owner. That's cold comfort to Cutie of course since no legal action is likely to be taken by the authorities.

In the interest of neighbor relations, he probably should just buy her a new cordless phone, one that he has tested to make sure it is free of harmonics that would impair his operations.

Pretty desparate, Drew. As I have said, nobody is interested in "unmasking" you, so there is no need to be paranoid. Anyway, why would some "other Drew" cry libel just because he were mistaken for you? Would that really be so terrible?

All that is called for here is to stop being so offensive and contribute constructively. You are dishing out a lot of abuse and hiding behind your anonymous and frankly, rather cocky sig. You must admit, your style would seem to others like you are deliberately antagonizing people, confident that it will never come back on you. It doesn't matter who you are; you are still you, and a very rude, tiresome, inconsiderate you to boot. What is so terrible or boring about just being a decent human being anyway? Is it such an effort?

Nat Heatwole
heatwole@clark.net

Well, Nat, you may have picked up a few bad habits that will hinder you somewhat, but you are probably not past unlearning them. What program did you use? Did the documentation mention anything about something called Farnsworth code? This is morse sent with the individual characters sent at a relatively high speed, but the inter-character spaces lengthened so that the total speed is lower. This type of sending lets you hear the sound of the characters rather than count the dits and dahs. the "counting method" is almost universally used by those who learn at 5 WPM and then try to work up. If you have Supermorse, a shareware pfogram well worth the registration fee written by WD5CID, you have excellent Farnsworth and random-character support. The ARRL VEs use farnsworth, with character speed at 18 WPM for the 5 and 13 WPM exams, and straight 20 WPM timing for the Extra. This is not an ideal speed for someone who definitely will go for the Extra license, but it is fine up to General/Advanced and will make you conversational. Look for other posts from myself, from Bob, N4FG I think is his call, (apologies if I do not remember correctly, Bob) and others on a nearly identical topic elsewuere.

Always try to copy faster than you can. If you are getting better than 80 percent copy, it is time to kick the speed up a notch. The total speed; you really ought to be using farnsworth with 18 or better, as Bob suggests, 20 WPM characters. Don't be intimidated. You will freak out at first because you can't count the dits. Don't worry about counting dits and dahs. losten to the SOUND. This method takes that crutch away from you and has you doing it the way 15-25 WPM ops all do it, by hearing the character and the occasional whole word. "The" will eventually sound like one character to you, dah didididi dit and you will write the word or think it as a unit rather than a T, an H, and an E.

Supermorse has a very challenging drill in it that closely matches a method used by virtually all high-speed ops, "copying behind". This means you are writing down the character you heard 3, 4, or more characters ago. This enables writing down whole words, and allows you to write cursively rather than with kindergarten capitals. The first time I ever saw this was a shipboard R/O copying the ARA news at 31 WPM as sent by WLO Mobile. I have tried this, and when I ever get off my butt and master it I am confident I can hit that so-far elusive 30+ WPM no-sweat copy.

By the way, WLO is excellent practice even at that speed for a beginner. You will only get the odd letter every other word or so, but I guarantee you will not count! Just hook up your TNC or Hamcomm interface, copy with the computer, and try to get the first letter of each word, looking at your screen for instant gratification or private humiliation. As far as I know, they still send the traffic list, Weather, and ARA news by CW as well as SITOR. I guess I better check them out and see if they still do. Anyway, the last freqs I have for them are:
434 KHz
2055.5
4257.5
6446.5
8445.5
8473.5
8658
12660
12704.5
13024.9
16969
17173
22686.5
26123

There are lots of other coast stations but usually they send their broadcasts a bit slower, some down around 18 WPM.

OOPS those were the working frequencies. Their broadcast freqs are:
4343
6416
8514
12886.5
16033.5
17022.5
22487
26135

I thought something was strange... 500 was in the list and they don't tie up 500 with the WX. Anyway, the other freqs are good places to hear moderate to high speed CW. Note that you will only hear one side of the QSO as the ships will be transmitting on one of its assigned working freqs, and WLO using WLO's working freqs. Split is the norm in maritime CW and you have to listen to the calling freqs and be really sharp to catch both sides, so just homestead of the shore station's working freq.

Do try to get on the air now, even though you are not really comfortable with CW yet. Don't worry if you freak out a little at first as you have your first few QSOs... this is normal, sort of a 'stage fright' or I guess "key fright" and you will quickly outgrow it. send "PSE QRS" when you need the other guy to slow it down. Most hams are happy to do whatever they can to ease you onto the bands and will send as slow and repeat as much as necessary. A little sweat and pressure is good for you at this stage anyway. I know I will catch heat for that remark, but I stand by it. I didn't really knuckle down till after my first couple of QSOs.

good luck and keep at it. I hope you end up enjoying CW as much as I do.

>rather than "translating a series of dits and dahs".
Yes?

I

WOW! sure are a lot of code upgraders today! This is really encouraging! I'm not gonna repeat my previous 2 or 3 posts on the subject verbatim, but briefly, try WD5CID's SUPERMORSE program. read the Docs thorouhgly for hints on how to use the program most effectively and learn the quickest. And yes, the type of timing you describe, called Farnsworth code, is a proven method that really gets results. Set SUPERMORSE to give you characters at 15, 18, or even 20 WPM and send the words at your working speed plus a couple notches. This is the most painless method to get up to conversational speed. If you want the carry-around convenience of tapes, record your own from the program, and change the tape daily to prevent memorization and increase speed. listen at a speed where you cannot get solid copy. When you are getting better than 80% it is time to kick it up a notch to keep you learning and not stagnating. Don't burn out... 5 or 10 minute sessions 3 or 4 times a day are better than cramming for an hour. Remember, your test is only 5 minutes, and you only have to get 70% of the questions, usually multiple choice, correct, or pass "the hard way" with one minute of solid copy.

This program got me up to extra speed in only a couple of months from scratch, and it would have taken me a year or more, I believe, with just tapes and onn-the-air listening.

In a phrase, "GO FOR IT".

Good point Doug... back in the 60's my father was an editor of a
newspaper and he caught real "bad guys" doing things to the public.
More often than not these guys would be yelling and drawing the
attention of the public toward some poor guy who didn't know
what the hell was going on, while he walked away with all the
marbles.

I hope the president's people are keeping an eye on the people
pointing fingers.

And no one is saying anything different are they?

>Sure time moves on...we don't drive horse drawn buggies,
>but they do exist.

Which is why a driver's license doesn't require horsemanship.
That IS the goal of nocode test advocates. Elimination of
te CW test by LEGAL changes to the regulations.

> A law student must study solved cases, a history
>student must study the alimo, we must take a driving test for a drivers
>liscense. Ham radio is a privelege not a right that must be earned not
>easily obtained.

Your point? Not one of the examples you give is in any
way synonomous with code tests.

In fact, ham radio is a privelege that is obtained by
passing a government test...and government tests should
be relavent as opposed to affirmative action testing
to preserve CW usage.

I personally thought that the response was in good taste and technologically accurate. Why the person was asking about the mod in an AMATEUR ng is beyond me, unless he or she had an interest in listening to what amatuer operators had to say. And why shouldn't that make sense?
The response from the ham is fine... he is not obliged to give a mod, whether he knows the mod or not, and he certainly is within his rights (and bound by his license) to keep things legal and clean.
Of course, I have seen many such responses from CBRambo and can only figure that he is not only not needed in the ham bands, but doesn't even WANT to be a ham, so why he hangs out in a ham ng and sends caustic, brainless and interruptive replies is also beyond me.
Then again, while he may scream all the time about how he hates "hamdom", there is a lot to be said for the 5 year-old who hits a classmate because he actually likes her, and that's the way he shows his interest. That would explain 'Rambo's mentality, would it not?
Mike in MO.

2 meters is the most used band, hencer lots of repeaters. I use a beam on horizontal polarization and a stick on vertical (triple 5/8 wave dual band-- 7.8 dB on S, 11.8 dB on 440) I have found this vertical workes better than one of my beams on 2 that I have set for vertical polarization. Swap meets sell these antenna for about $140. They are 17 feet like with three small radial--put it up as high as you can get it and you will be able to work a wide radius on 2 and 440. I love my 2 meter beam on horizontal. I've worked a 350 mile radius during band openings last year. Under normal conditions I can get 100 miles or more simplex with another good station at an equally high location.

440 opffers more privacy and given the bandwidth availabe provides lots of space for people who find 2 meters too crowded and also for people who enjoy the options of crossbanding--a cheap way to duplex two bands into one antenna.

220 is a quiet band--rarely used in the US since Japanese does not have that band I'm told), the rarity of radios makes it very private--except in Calilfornia.

I can talk 100 miles in normal condition on two meters, around 60 on 440 with a good antenna.

6 meters is the band you want. Normal conditions yield an easy 200 miles with a decent antenna. 6 meter FM requires only an easy to get Technician's license. It is my favorite band. If you are on top of a mountain you will kick ass with 6. Trust me.

Horizontal polatization decreases noise--most noise is vertically polarized, but requires a rotator unless you stack halo's and allows you to null out signals you don't want. I like to have two antennas, one on each polarization depending on the station I am working.

For 6 meters, I have a (Hygain--I think) double 5/8 wave vertical antenna and a 5 element Cushcraft beam for horizontal. The Cushcraft kicks ass and has a short boom and fabulous gain. I've also had fair success with simple dipoles made out of old ski poles feed with unbalanced coax. I plan to change two of my ski-pole dipoles into a Turnstyle antenna next (see book ref). I also plan to build some halo's--a folded dipole bent into a circle--adjust impedance buy the spacing of the ends--a few inches of separation will give you 50 ohms. Check out the ARRL Antenna Book for other ideas. Stack for more gain and omni pattern on horizontal polarization!! Cool!

When the band is in, you can talk to europe on 6 meters. That has never been done from the Eastern US on 2 meters, although contacts from New England south to the Carribean have been done.

10 meters is not a bad band, and opens more often than 6. In the next three years you should be able to talk to any place on earth as the band opens up. You will need a General or better license to operate on FM on this band. With a Tech Plus license you can use it for SSB. I use a vertical Solatron (Antron) 99 antenna--it is cheap and I've talked all over the US on it and it works ok locally. these antenna by virtue of their size have limited gain--so pour on some power if you need it. A 3 element ten meter beam is a good idea if you decide on 10.

SSB is a mode that will get more power into your signal--hence longer distances. I personally prefer the sound quality of FM, unless I'm trying to save power while operating maritime mobile. I don't like in pain of tuning required by Slop-Bucket (SSB).

I hope it didn';t bore you with too much info.

Ken,
Further to my reply to your request. The site I gave you has such a wealth of information that I may be able to narrow your search down a bit.

Two useful documents are:

"http://www.itsnet.com/home/ldragon/Specs/adlib.html"

This is an excellent source of info on using the FM music facility to generate sounds.

The other is:

"http://www.fys.ruu.nl/~bergmann/soundblaster.txt"

This gives the above plus sampling and replaying audio using QBasic.

I have lots more links if you need other data.

OK, Michael, I'll play your silly game. I'm going to invent the phrase, "Pro-code-test-a__hole" and create the definition of "the nicest hams on netnews". So when I use it from now on, it doesn't mean what it appears to mean. It means the definition I created for it and it is a compliment.

I have to agree with Mr. Crusoe. Get on the air. I did it about a month ago. I "lurked" until I found another novice, then when he signed with whomever he was talking with, I pounced. The first two or three QSOs were really hard. I had cold sweat getting through them. I just kept on with it doing one or two QSO's each day as well as using Supermorse code practice. You will find, as I did, that there are a tremendous number of nice people out there who are really interested in helping you out. I have only had one that was not helpful and he simply disappeared. Last night I "talked" with WL7CDC in Anchorage, Alaska (I'm in Washington) for 45 minutes. He operated at 13-15 WPM, I worked at 7 to 8 WPM. I had no trouble at all. I am planning on my general code test in May...and I won't have a bit of trouble with it.

Any ham that has had an Elmer should have been told of the band plans if the Elmer was doing their job. I don't have a problem with a ham, new or not, that accidentally steps on the band plan, and then complies when they learn what it is. It is the operators that know what the band plan is and continue to just step on everyone else just because they care for nobody else other than themselves.

The ARRL has announced that this year they are going to work on a petition to the FCC for rule changes that will make willful violations of the band plan the same as willful interference, and therefor, a violation of FCC rules.

Hi all!

1. Still wondering what center frequency is most common.
Mark signals are (always?) on 1275. The space frequency depends on the
shift of a signal.
So how can you say that there is ONE center frequency?

2. Also: isn't the mark frequency the actual frequency of a data
station?

3. I wonder when you use a decoder with a fixed center frequency along
with a radio control program, you can tune the station 'in the middle'
of the center frequency, just by tuning in via the database??

Yep, 3 questions... when you have any opnion/answer etc to one or more
of them, please let me know.
Any contribution will be very appreciated!

>anybody?

There's no doubt we can improve on current EME practices. With improved signal design and coding, contacts between Oscar class stations should be easily possible. In fact it has been done, once. But data rates will be extremely low. Active amateur satellites offer much more. When Oscar 10 was in top form, it was like another 20m band, but with predictable propagation. P3D will be much better.

And of course the pacsats are easily accessable with low power equipment today. AO27 offers limited satellite FM repeater operation now, as does the repeater on MIR (when working). And the equipment slated for ISS will allow most amateurs to participate with little or no additional investment. But capacity is, and will be, very very limited, and footprints and windows are relatively small.

We need something beyond P3D and ISS, and there is nothing currently in the pipeline which offers their capabilities, or expands upon them. Ideally what we want is a 3 satellite GEO constellation, each with 24 30 MHz transponders, giving us 24 hr global coverage. The world's amateur satellite community is capable of building the satellites, but there doesn't seem any way to fund their launch.

We could do it if every one of the world's amateurs kicked in $180. But the odds of that happening appear to be slim. The world's hams will each spend thousands on a HF rig, but won't part with $180 to get 720 MHz of 24 hr worldwide spectrum capacity (That's 2057 20m band equivalents.) We're struggling just to cover P3D's costs. Sad.

It's not just on TECHs on 2 meters. Go down on 40m and listened. Packet in the Novice CW section. CW on the RTTY DX frequency. These are General and up classes that are not learning/using the band plans.

When I was a TECH+, it was very frustrating to hear all the packet as high as 7.110. 40m at night is hard enough to work with the AM broadcast stations in there. The digital folks would suck up a large percentage of the "usable" spectrum available to novices.

So where do you get your figures that there are 2.5 million people in the world that want to become ham? And just why should there be that many? Don't know about you but I sure have never had a problem with finding someone to work unless the band was dead.

> Having to learn an outdated
> protocol, ie morse code, to advance beyond "tech" is silly, and is certainly
>
> contributing to the problem.

Does not seem to be a problem for the thousands of new no-code techs that get licensed each year. If they are happy using vhf and find their "nitch" there then FB. Otherwise they can study a bit and upgrade. Of the several no-code hams I know on more than just a *ham radio* basis, not one of them has anything against having to learn the code if they want to upgrade.

> What's the point of having to learn morse?

For one reason it gives us a national resource of communicators for the time when other modes may fail.

For another it does filter at least some of the lids out of the ranks. Before we lower the requirements let's get some teeth into the enforcement of the rules to get the garbage ops off the ham bands.

> Do you ever become frustrated because of the
> ridiculously high prices on most amateur radios? It would seem to me, if
> there were _more_ demand the prices would perhaps "moderate"?

If you look at the price of manufactured rigs to the value of the dollar you would probably find that radios are cheaper now then they were 20 years ago. And heck, you can get on the air on CW for a couple of hundred dollars even if you buy a new manufactured rig.

If you go to a swapfest you will find plenty of radios that will get you up and working for very reasonable prices. And you can build a radio that will let you talk anywhere in the world for a hundred dollars or less.

Message-ID: <2b5z.1538$7G1.198410@news.internetMCI.com>
Source record: 180578

I'd have to disagree with these suggestions. Do NOT listen to the air before taking your test. ONLY listen to Farnsworth code sent from tapes or a computer (perfect code). Listen to the air after you pass your exam. But until then you should not be worrying about who is on the air or what the protocol is or how to copy through QRM, QSB and QRN. Your main goal is the be able to copy Farnsworth code at 5wpm in a nice setting. After you pass your test you can worry about operating in "real world" conditions.

I used the tapes as a lesson guide and then used the computer to practice on. Never doing anything but random runs. I would set up files for the random runs that only had the letters I'd learned so far and run them through the program. Also practice with some letters you don't know thrown in there. This will help you to write down a dash and move on. I also would move my fingers over the letter I just wrote so that I can't read it. I also practiced at 20wpm character speed and 7 wpm word speed. This will help with your character recognition speed. You want to be a machine for your test. Hear and either write it down and write down a dash and be ready for the next letter. Listen to the 20wpm and 13wpm test and copy everything you can. You may not copy much but it doesn't matter. After copying at 13wpm, 5 seems really slow. You only need to know the letters for the 5wpm test. There is enough time to hear a letter, translate the dits and dahs and write the letter down. (13 and 20 you just have time to hear it and write.)

Now all that being said, when I got on the air I had a hard time adjusting because no one sends Farnsworth (and some don't send anything well). The first QSOs were hard because there was no time to translate the dits and dahs to letters. But at that point I had the license and all the time I needed. When my speed got up to about 12 wpm I took my 13 and passed. That was after about 150 QSOs spread over 7 months.

Like any enterprise, the ARRL is ultimately driven by solvency, and that depends on satisfying its customer base. Whether you call them members or subscribers or publications purchasers makes no real difference. They are paying customers. And when the opinions and behavior of the paying customers change, the ARRL scrambles to catch up and tries to appear as if it were out front on the particular issue all along. Of course that has been quite transparent to any rational person with a knowledge of their prior positions, and is one reason the ARRL's membership is a declining percentage of licensed amateurs. You only have to look at the history of the organization over the last three decades to see that.

>>Since the ARRL certainly isn't
>>going to make any meaningful efforts to publish views opposing its policies,
>>that leaves forums like this for use in that effort.
>
>If you want to hear yourself "preach", in the hope that everyone will be
>impressed with your viewpoint, go on....and on....and on.

As the FCC has said repeatedly, they aren't going to act in this matter against what they perceive are the wishes of the amateur community. In the past, that has meant whatever the ARRL tells them is the wish of the amateur community. That's changing today. The ARRL has less of a stranglehold on mass communications to amateurs through which to mold opinion and manufacture consent. This means that there are now other venues through which the opinion of the amateur community may be led to support reform. It is essential that a majority of the amateur community be impressed by our viewpoint before we can enact needed change. These newsgroups are one of several forums where a large segment of the amateur community can be reached.

>Since you apparently did not understand my original post, let me put it another
>way: It strikes me as trying to sell ice to Eskimos, or sand to the Arabs.

Then you obviously don't understand how popular opinion is shaped. Public policy debate is a critical component of shaping opinion. It is most effective when your opponents make themselves appear to be unreasoning luddites. And fortunately, there are a large number of that sort in the pro-Morse testing contingent here. I keep a file from which I regularly forward the choicest gems to the appropriate people. People

like Richard Carroll and Larry Roll have been most helpful in that
regard. A number of lesser lights have as well.

>If you are too lazy to look up the names and e-mail addresses of those who can
>make a difference in the CW requirements (or any other issue), then feel free
>to post as much as you want to the NG. Those who don't want to hear any more
>can filter out the participants by screen name or subject lines.

In fact I am in almost weekly contact with FCC staffers and Commission
members (I was on the phone with my favorite Commissioner just this
morning), and have done so since 1981 when the FCC first raised the
issue of reform. I like to think that I had some impact on the reform of
Tech licensing through my formal and informal contacts with the agency.
That they quoted some of my comments verbatim in the final order lends
credence to that belief.

I keep in touch with some ARRL officials, and officials of other amateur
organizations (I'm a member of several of our national organizations),
and I maintain informal contacts with a number of domestic political
operators with influence in this area, IE staffers of members of the
House and Senate committees responsible for telecommunications
issues.

I also maintain informal contact on a regular basis with certain staff
members of some other nations' telecommunications authorities,
and with certain members of some other national amateur organizations.
If you think that all I do is post to usenet, you are sadly mistaken. But
it is one useful forum for shaping the amateur community's opinions
with regard to licensing reform, and also serves as gist for those gems
which tend to shape opinions of policymakers.

In the matter of Tech licensing reform, comments ran 9 to 1 against,
but it was mostly the tenor of the comments of those who were against
which helped carry the day. Irrational emotionalism and poor cognitive
skills tend to have that sort of unwitting impact. I have that direct
from staffers whose job it was to read them and then formulate the
position the Commission would take.

>issue of radio or telephony. Reference the Tenth Amendment.

The Supremes have interpreted the Constitution differently, witness
federal preemption in the case of radio and telephony, examples include
PRB-1, and most recently carried so far as to even preempt private
covenants with regard to small satellite dishes and broadcast TV outdoor
antennas.

>2) Law enforcement may obtain court permission to make recordings that

>meters, about some illegal activity, such a tape would be inadmissable
>in court.

Actually that was the Communications Act of 1934, as amended. But
amendments include the ECPA which makes monitoring, taping, or
rebroadcast of certain classes of radio transmissions, including
amateur, perfectly legal while totally outlawing monitoring of certain
other classes of radio communications, notably cellular phone.

>3) Kenneth Starr may be operating under Federal law, but he is still
>compelled to obey state law, and if he asked Tripp to make these
>recordings, he may have violated the law of MD or VA, or wherever the
>hell it was.

Unfortunately for your argument, federal law is held superior to state
and local law. It is subservient only to treaties and the Constitution
itself. The Supremes have so ruled, and theirs is the final word on

all things legal in this country.

Well, as said by others you can continue to build up your speed with the computer program but don't overlook the fun method. Get a station on the air and start working some cw contacts. Then it is not as much work as it is fun.

Congratulations Nat!!!!

There's only one solution for such a problem: change the frequency or hit
the "off" switch if you don't like what you hear.

Besides, does the FCC have different rules regarding profanity for different
radio services? Is there one set for broadcast stations and another set for
two-way stations? If so, I'd like to see some clarification.

> Mike in MO.

Welcome aboard, for a long watch at the key. I hope its joys and fraternity
will be with you all of your days.

There are two things that you must do to learn the code. They are very
simple, in reality, but sadly, most folks go to all the trouble first,
and learn the art after the fact.

The first thing that you must do is learn the patterns, at speed.
You need to train your ear and neural system to recognize the discrete
patterns of the code. For most folks that is pretty easy, but for
some it can be rather difficult to get the ``hang'' of it.
What is required is to learn the patterns of ``sound'' (not mental
crutches or tricks) and their corresponding characters. That can
be done in a couple of days to a couple of weeks for a speed of say
5-7 wpm. In this phase, you are merely doing the rote association
of a sound with its character. That is usually the easy part.
Next comes the pushing of the speed to train the ear to recognize
the patterns at speed. That is a little more difficult, because
you must push yourself to do this at increasing speeds. Many
folks can hear it fine, once they get the letters and sound patterns
learned, but some folks can't, because of hearing or other problems.
Most can, though. We have had YL's come in with their HAM feller,
and wind up learning the code very quickly, because they learned it
at speed rather than bumping slowly up the ladder. There seems to
be a speed around 22-25 wpm, that this maxes out at. But, up to
that 22 or so wpm, you should be able to rachet up the speed and
still hear the characters. As you rachet up the speed, you must
practice and practice and practice, as the old saying goes. Some
folks can do it in a week or two, most take several months, and a
few never seem to be able to train themselves to make the associations
at speed. The idea is to force yourself to pick up and register the
character patterns at speed. Don't waste time at 10wpm or 13wpm
or 15wpm but go on to 20, right from the start. You may be amazed

at what your ear will actually hear at that speed and faster.
After practice at 20-22wpm, then drop down to 13wpm and it seems like
a liesurely walk in the park. The only way to get there is to
practice. There are NO shortcuts, regardless of what the folks
will try to sell you. The crutches that they sell you are only good
to a certain point and then are less than optimal, at best. Crutches
are fine for 5 wpm, and they may get you to 13wpm to pass the test,
but, they are no substitute for the actual learning of the sounds
at speed. Once you have learned the sounds at speed, then you
can embark on the most important thing you must do.... step 2.
Once you have learned the sounds at speed, you are a bit like
a trained automaton, but without the humanity that is required.
I expect even the faster computers can do this kind of thing,
relatively well, under optimum conditions. Folks seem to tell
me that they can, but, there is more to being a CWist than just
being the computer end of it.

The second step is what you will carry along with you the rest
of your life. That involves the building of a practical working
linguistic CW vocabulary, at speed. This is the place where most
folks seem to fall apart. There is a certain minimal linguistic
vocabulary that you need to become conversant as a CWist. Without
that, you are merely the trained monkey. Take a paper and write
down the 200 most common words that you are likely to use in ham
radio on the air. 200 words is about the minimum that works.
Then you must learn that vocabulary, at speed. Just like you
learned the sound of ``words'' as a baby, you need to do it again,
as a CWist. Most of what you exchange on the air, unless actually
pushing traffic down the line, can be said in about 1000 words.
If you have a 200 word working vocabulary, then that is about the
minimum that will get you going effectively. In this phase, you
are not merely listening to the individual letter patterns, but
are listening to the entire word patterns. But, to use it, you
must be able to recognize the entire words, at speed. Do a sort
on the list by length, and learn them that way. Learn them until
they don't sound like individual letters, but sound like entire
words. Again, that takes practice and practice and practice.
Get a simple cw sending program and generate the code to listen
by, or make tapes of it that way. Keep the speed up at around
20 wpm, minimally (a range of 20-25 will do). Don't ratchet the
speed down, but keep it at that rate. Send that sorted list
with 5 repeats per line of each word, until the entire list is
sent, and learned. Repeat until learned. Once you get the hang
of it, it becomes easy. Some folks do this naturally, some don't.
I expect it has to do with how the brain is wired, neurologically.
But, without learning that vocabulary, you may have a difficult
time, getting beyond about that magic 13wpm. At this time, you
will be getting into the learning to copy behind approach. That
involves buffering the input into the brain until a whole word
is there, and then consciously processing it. The old stories

of telegraphers on the line, sippin' a cup of mud, reading a book, chatting with the folks at the window, and not missing a beat, are based upon the ability of some folks to develop that vocabulary and buffer so that they can copy as much as a line behind or more.

It takes a trained ear to hear the characters at speed.

It takes a learned vocabulary to use the words at speed.

Do both, and it will be a joy to you for all of your days.

Good luck.

MD misses the point. Of course the FCC is the ultimate arbiter
of any decision...and the more support out there the better. That
still doesn't change the fact that the editors of magazines MAY have
championed the nocode tech license AND may have even
speculated on what it might do, they (the editors) owed no
one any promise tht such end results would be guaranteed.
Additionally, the FC sure didn't either.

>>Seems that if there wasn't a codeless tech license we'd have far
>>less hams than we do now.

>Hmmm. So, is your sole criteria "bodies"? What else can we do to
>ham radio to increase the number of bodies? Lesseeee... If we gave
>away licenses in boxes of Fruit-Loops and Frosted Flakes, we'd get
>a lot more "young people" in the hobby! Yeah, that's the ticket.

More MD bull. NO ONE is proposing giving away free
licenses. I have stated over and over again that, all that I
see as the rational to end code testing is the simple fact that
there is NO compelling reason anymore to retain it. There'
absolutely no reason today to require all HF hams to know
morse.

>>Additionally, I recall no one saying
>>we'd have hoardes of high tech types coming in.

>Revisionism in action. Go back and re-read the editorials and letters
>from the mid-80's to 1988 in QST and other magazines.

So a couple of editors made such statements. Do they speak
for all hams?

>>That's more a problem (IMO) with a code requirement today than
>>with nocode.

>There is no evidence to support your assertion. Only your personal bias
>woven into a "crisis" for ham radio.

I have first hand knowledge of competent technical people
who would be good hams, but have no time to do the code
requirement. That's sufficient evidence for me.

>>Hey Mike, in other posts you say people are upgrading which
>>is why there are more extras today than a year ago. Which is it.

>The fact that there is a reasonable percentage of people upgrading
>beyond codeless tech is irrelevant to the fact that the license is a
>"dead end" license. It was specifically created for people who don't
>want HF access. It represents the one and only license class that the
>majority of people holding it will ever have.

The tech license has always been somewhat that way, even
before the codeless tech was created. I was a tech for
about 30 years. Many others were also.

>>Once again, MD tries to taint the nocode TEST group by
>>ignoring that many of us ARE coded hams with higher than
>>tech licenses.

>So? Its just the same crowd from the mid 80's.

Such as who?

>>Bure unadulterated trash. MD wants you to believe that the
>>nocode TEST group wants to BAN CW. That is bull and
>>he knows it. There hasn't been a single post from anyone that
>>would even appear to want that.

>The pure, hate-filled vitrol posted by the No-Code Agenda Poster Boy,
>Carl Stevenson -- his disdane for anyone who enjoys operating CW, his

>visiting DejaNews -- is more than enough circumstantial evidence to
>show that the true motives of some (not all) of those involved in the
>No-Code Agenda is to completely ban CW from amateur operation.

Well Carl may be ONE, and there can certainly be some, but your
branding the entire group as you did originally is still bull.

>>The reality is that neither I nor anyone else posting
>>here in support of ending code testing has promised MD or
>>anyone else anything as regards the nocode tech license.

>More backpedaling.... Kind of like Bill Clinton: "err, I never had sexual
>relations with that intern" (of course, since Clinton doesn't consider
>oral sex to be 'sexual relations', he believes he is 'telling the truth'.)

>In a similar vein, Bill Sohl claims "I never promised you anything".
>Well, he is right -- he never did. Of course, the movement which he is
>part of, that he identifies with -- did promise certain things.

Please find even one such example. Just who promised what?
MD keeps saying that but I still see no such examples other
than vague references to past QST editorials...as if the editor
of QST had any power to fullfill such a promise.

>>MD also ignors again the large expansion
>>of the Novice and Tech question pools in July of 97.

>Double nothing is still nothing.

That sure says a lot about MDs attitude and willingness
to effect any meaningful change rather than just bitch about
the size and type of questions.

>>>There is no resistance to change in amateur radio. Amateur radio is many
>>>things to many people. Some like EME, some like CW.
>>
>>To bad MD doesn't believe what he writes in terms of appropriate
>>test requirements.

>Bill Sohl ignores numerous postings from myself where I publically
>state that I openly support "mode-based testing", where individuals are
>only tested in those modes they wish to operate.

And MD knows full well that such mode testing is neither needed
nor ever likly to become a reality. Supporting that which has no
probability of coming about is always easy.

If you simply expect those of us in support of ending code to
go away, then you are in for a long wait. The purpose of
writing here (long or short articles) is to continue the discussion
and bring it to the many that do read this newsgroup.

Bill ... please don't let Mike sell his "Carl wants to ban CW
from the ham bands" lies to you ... I have repeatedly stated
that I would not seek, nor would I support, any attempt to ban
the voluntary use of Morse by anyone anywhere in the ham bands.

Mike spouts LOTS of lies and altered posts designed to make it
look like folks said things they didn't say ... please don't
buy into his lies just because he repeats them so often. Brand
him as the liar he is and ignore the lies no matter how often
he repeats them, for a lie is still a lie, no matter how often
it's repeated.

Christopher (Chris) W. Boone <cboone@earthlink.net> wrote:
> A trickle charger SHOULD be a constant voltage charger....that is
> the VOLTAGE remains constant even when the load current changes..

Not necessarily. Much can be said for properly proportioned constant current charging even in trickle installations. It is not routinely done, because it is easier to design voltage regulation chargers rather than current limited ones, for the general masses.

> Wall warts are NOT constant voltage by design...the voltage decreases
> as the current drawn increases.....(simple resistor drop or
> just a xmfr and rectifier...no voltage control)

Wall warts are miminal charging devices at best. I would build my own, instead (and do). I build special battery chargers based upon radio designs from the 1920's. Batteries have not really changed since those days. They are built better and packaged better, but the chemistry has mostly not changed. A current limited charger using the battery voltage times 3 or 4 with a properly proportioned current limiting resistor is ideal, and will always properly charge the battery, if you set it for the right current requirements for floating, standby, or cyclic modes. Nothing mystical about it.

> To keep a wet cell from overcharging (or boiling dry), the charger
> should be well regulated....a 12V PS can be used if it meets such
> regulation requirments

Not necessarily. The regulation, per se, has little to do with the battery charging. There are many instances where improperly regulating a battery at voltages too low, can cause the battery to never fully recharge, just as setting the voltage to high for long periods of time will outgas the battery under overcharge. The battery goes flat, and folks think they have outgassed them until the electrolyte is gone, when actually they are never fully recharged.

>....With the battery fully charged (and a fully
> charged wet cell battery for 12V DC uses 6 cells, each capable of
> 2.2 Volts), the voltage should be about 13 volts.

That depends. You must consider the load drawn from the battery, the required charging current and time, AND the amount of specified overcharge the battery must have. Those things are often only found in the manufacturers tables, but sometimes are in the literature with the battery or stenciled on the battery. Without those values, you have to compute the load you use and the required charge per unit

time to keep the battery fresh, even in floating stationary installation.

> Set the power supply
> at 13.0 Volts (not 13.8!) if it has a diode protected output (a diode

> ever is highest....then set voltage on the BATTERY side of the diode
> for 13.2, attach battery and radio.....(when battery is fully charged,
> and radio is not turned on, the supply should show ZERO amp current
> draw)

Mostly correct, but I would differ with you in the current that the battery should be taking in, in stationary use. A proper floating charge is never zero. In the literature I have seen it will usually be in the neighborhood of C/200 to C/400 in value, but never zero. If it is zero, the battery will never fully recharge, and slowly begin to sulfate up, after some use. I think this is where many folks get the ``dead battery'' after just a short use as opposed to overcharging them to the point where the electrolyte is burned off by outgassing under overcharge. You will need to consult the manufacturers ratings, but for a battery of say 100 ampere hour capacity, it needs to have a charge of around 100/400 or 1/4 ampere applied to it continuously to overcome chemical degradation of the cells. If that is not done, it will require a topping off charge (around C/20 to C/50) periodically (every 3 to 6 months) to prevent degradation, and occasionally a full cyclic discharge/charge at the normal cyclic charge rate of C/7 x 120 percent. The extra 20% is the overcharge needed to fully bring a discharged battery up to charged state. If you forget to factor in the overcharge required, your battery will go flat. Underregulating the voltage will cause it to go flat. I would trust C/400 actually measured for the particular battery rather than arbitrarily using 13.0 or 13.8 or whatever volts to charge with. That has always worked for me.

Always use the reverse current protection, especially if using a regulated power supply, because the regulation transistors will fry with backcurrent if the power supply is turned off and the battery is still connected. That is not absolutely required with unregulated power supplies, but is still a good idea.

If you manage your batteries well, they can serve you many years. I have been running the same set of 105 ampere hour batteries for almost 20 years, and they just keep on ticking, if I take care of them (main shack batteries used generally, on field day, and for emergency). On floating charge, others of mine have been going for about 8 years, with no problem (standby lighting batteries).

Good luck, but use the proper charging values, whatever the installation requires for the particular battery used.

They used alternators and arcs (Poulsen's arc converter from about
1910 based upon early work of Duddell about 1900 if I am remembering
right, today). It was used as a LO for reception, also.

> But I'm curious how SSB was generated without a CW LO and how

> 1915 to supply one.

Vacuum tubes were available in 1914, commercially, to some extent
and the GE/WECO folks used them in early repeaters for telephone
use. Early oscillator experiments were done about 1914 with
work by Hartley, Colpitts, and others. Some of the early work
can be found in the GE/Bell/Electrician journals of the period,
but it is a little hard to find. I would love to see Hartley's
or Colpitt's notes from that era. Early work used Duddell's
arc or Poulsen's arc for the LO source, in addition to the
vacuum tube. Such LO's were called ``external heterodynes''
and were actually the first direct conversion receivers (contrary
to what hams believe in it being a 50's/60's invention) which were
called ``heterodynes''. The Navy experimented with a few such
receivers in about 1914 and they were generally poor. In WWII
it formed the basis for the excellent RBA LF receiver.

I would like to look that up. Can you cite a reference for it?
Also, one Dr. Mahlon Loomis was attributed to have done some wireless
experiments across mountaintops in Virginia, around the same time.
His daughter was the president/founder(?) of a radio school in D.C.
and had a neat early radio course book dating from 1925 or so that
details some of it (c.f. Loomis, M.T., 1925, Radio Operating.).

2462. Increasing My Code Speed

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-26 00:00:00 UTC
From: Nat Heatwole <heatwole@shell.clark.net>
Message-ID: <6agsio$qcr@clarknet.clark.net>
Source record: 180620

Hello. Earlier today I passed my Novice Ham Radio license. The written part wasn't very hard, but I did struggle with the code a little. But I was able to make it out and I passed the 10 questions part of the code test. My question is, is there a way for me to increase my code speed up to 13 WPM? I hope to take my General class license soon and right now I can barly do 5. I copied about 50% of the code tape correctly and some of it was a little sloppy.

I learned code by first studing the letters and then using a code program on my computer to get it up to 5. Should I use the same computer program and just slowly move up the speed until I get up to 13? Or is there a better method? If you have any suggestions on this please let me know. Thanks a lot in advance!

for ham recruits?

Paul
N5DUP

You are right. Paul. I have touched on this subject myself. There are a lot of CBers who are only in need of a bit of education to make fine ham ops out of them. Most CBers like 11 meters because they genuinely like communicating over the air or are fascinated with little boxes that allow them to do so. Many, with no technical experience or reference material at all, perform quite valid experiments with antennas, feedlines, ground systems, etc. On my brief forays onto 11 meters I was impressed by the curiosity of some of the CBers I met, and hopefully I and others like me have motivated a few to take up our hobby. By and large, most of the lids on 11 are the way they are only through ignorance, not through malice. Maybe we ought to have a CB contest! We could require at least a 10 minute QSO for points, and round-table discussions on technical topics could be multipliers. I see no reason other than the cost of a cheap CB and prejudice against CBers why it could not happen. In fact, can't you still legally homebrew a crystal controlled rig for CB? AM is not as simple as CW, but it's still pretty easy.

More opportunities for long-haul comms on the high bands would ease the pressure too. I think DSP is really gonna start making a bigger impact on EME, and as technology improves we will have pre-amps with lower noise figures that will also help make EME possible with more modest power levels and equipment costs. The new satellites will help too. When a newly licensed ham can make a transatlantic contact with an HT, demands on HF use by no-coders will abate somewhat. I don't think VHF, UHF, or higher spectra are being utilized at anywhere near their potential, but maybe we are on the right track. Simplifying the building or buying of gear for more exotic modes that simply are not possible on HF could help too. A $300 24GHz handie-lookie ATV rig, anybody?

>Morse code!?!..really, why don't we all just demand the
major car
>manufacturer's revert back to the model-T.

Actually, not a bad idea. With todays advanced casting and machining know-how, Detroit couldd probably turn one out brand new for under four grand with much tighter tolerances than the original. The average shade-tree mechanic could keep it running without a big-ol' computer analyzer, too. The only things that would really need updating are the hand-throttle and manual spark advance. Well, I guess seat belts would be a good idea too, and complying with emission standards would require some changes. Otherwise, good for everybody except the manufacturers, who wouldn't think well of a product that only needs replacing about once in a generation, or drivers who simply MUST drive 70 MPH because they don't have sense enough to leave early enough to get where they are going on time.

Henry Ford meant for the model T to be the car for the ordinary working man... one he could afford to buy and keep in good mechanical condition. Most cars today are basically throw-aways. Things start falling apart about the time the warranty expires. The answer? buy a new one. After all, you had the old one for three whole years already. It's almost paid for, too. Don't be a slacker... support your growth and consumption oriented credit-driven economy. Hurry up and get back in debt

Sometimes, simpler is better. It sure can be cheaper.

Kinda like CW.

My opinion only,
Mike
>in MO.

Hang in there, Mike. You got the right idea. I was lucky... my elmers were the two R/Os on my ship, back in the days when we had R/Os. CW was a way of life, not just a quaint aspect of the hobby held either in contempt or nostalgia. My original intent was to use ham radio as a stepping-stone to my commercial radio-telegraph license and USCG R/O license. So, there was never any thought, debate or indecision about code/no-code for my first license, even though the no-code tech was available and getting popular. I did not labor under the discouraging and disparaging voices of nay-sayers the way you have/are, who call CW a counter-productive relic. So, I admire your fortitude in bucking the trend. Hang in there, because the rewards are worth the small effort. We need more hams with your kind of grit.

If you need any help or pointers, let me know. I been there, and while I might not know the best way, I know what worked for me. Meanwhile, 5 WPM IS CODE, and we all had to crawl before we could walk. Some crawl longer than others, but it beats sitting on our duffs. Anybody who doesn't respect your efforts rates my contempt.

HLDL HLDR

BENS BEST BENT WIRE

HI HI vy nice drill. it really sounds neat!

I second everything posted so far, Mike. Don't concentrate too much on the tapes. Download SUPERMORSE. It takes a while to get it set up properly on your computer, but then you have a multitude of different kinds of practice and learning sessions available. I used to run it at a higher speed than I could even come close to copy, on my nearby notebook while I slept. Then, when I got up, I would turn the speed down just a bit and have a very nice practice session. 15 WPM sounds reeeeaaalll slow after going to sleep and waking up to 25 WPM.

Listen to the Random Groups with Supermorse mostly, and an occasional text file when that gets boring. Listen a lot, but don't spend more than 10 minutes at a time seriously trying to copy. 3 or 4 sessions a day, 5 to 10 minutes each are far better than cramming for an hour a day. Meanwhile, jget used to the SOUND of the code. Don't listen to code so slow that you can easily count the dits and dahs, because then that is exactly what you will do. This cripples you when you try to upgrade to general. The mind has a hard time processing code that way at anything over 10 WPM, hence the infamous 'hump". The "Farnsworth" method of learning is a Godsend. The individual characters are sent at a fairly high speed, fast enough that you must learn the sound of the whole character rather than the number of dits and dahs and their order. The spaces between characters and between words are lengthened to make the actual throughput match the nominal codespeed. You thus have plenty of time at first to ask yourself, "now what WAS that character?"

A big advantage to using Farnsworth style timing is that the ARRL VE teams usually use farnsworth code for the exam. for 5 WPM, characters are sent as 18 WPM and the spaces lengthened to make throughput = 5 WPM. Get used to it before you test! General speed is similarly timed, and Extra speed is just straight 20 WPM characters and spacing. It is easy to see how learning Farnsworth style right off the bat will help you upgrade more easily.

SM has a great random QSO generator, and can even give you a randomly generated sample code exam. I suggest that you do not use this feature until you are fairly confident that you can pass the test. The sample exam feature should be used only as a confidence builder the last couple of days before the test.

Occasionally, listen to plain text. After a while, short, commonly used words like "the', "at", 'rig", etc will have a single sound, and you will hear the word rather than the letters that make it up. Do not spend more time on plain text than you do on random groups, though. If you can copy random groups, you can copy anything. That should be your personal benchmark.

There is a "copy behind" feature that asks you to enter a character you heard 2, 3, or 4 characters earlier. There are various head-copy study modes, and they will all challenge you to hear the SOUND of the code.

There are learn mode excercises that are of great help in getting started in the code from scratch. They emphasize a completely audio approach to learning the code that relies not on counting or visual decryption, but on SOUND right from the start. Of course, you are already beyond this point, for better or for worse, but no time like the present to break habits that will slow you down later.

If you seem to be up against a wall and making no progress, give it a break. Stop for a day or two, and then go at it again. Amazing how that works! Above all, don't get burnt out.

my website is http://members.aol.com/RCrusoe/ab5vh.index.html. That is just one of dozens of places where you can download SUPERMORSE. If you need any help and the doc seems vague, drop me an e-mail, and I will be glad to help.

BTW, supermorse got me from zip to 20+ WPM in just a couple of months. I think even though I had a lot of motivation and HAD to get up to 20, it would have taken me a year or more just listening to tapes and on-the-air code. The tapes I found of rather limited usefulness due to the memorization thing. On-the-air code was somewhat better, especially the W1AW broadcasts, but I had to be able to listen by their schedule, not mine. Live QSOs were good for learning operating practices, abbreviations, etc; I would follow along, copying one side and 'send' with an "air key" along with the other station. Still, for learning HOW TO PASS THE EXAM, software is best.

One more thing... there is one way in which code tapes can help you. Get yourself one of those little micro-cassette recorders that use the old-style answering machine cassettes, run the program, and tape the output. use the tape for a day, then record over it. That way, wherever you go you can take your code practice with you, and have a mini-session listening to code sent exactly the way you want/need.

One more one more thing: listen at a speed where you only can copy about 80%, and keep moving up as you gain proficiency. The reasons are two-fold. First of all, in a casual ham QSO as opposed to commercial operating, it is not unusual to be satisfied with 80 or 90% copy, and just fill in the gaps according to context, and requesting repeats only where a missing letter or word is important and not easily guessable from what was actually copied. This will get you used to not getting hung up over missing a letter or even a word once in a while. Also, when you listen faster than you can get perfect copy, you are pushing yourself harder. It is the challenge that makes for rapid learning. If you go for perfect copy at one speed before moving on, you will move up pretty slowly.

Good luck!

anything that I don't like.

Hmmmm... now why would anybody do a mean thing like that? After all, everybody enjoys reading a post that either asks for help, offers help, or presents a view (whether similar or not to those of the reader) presented in a logical, inoffensive manner. Who would someone cancel a productive post that's sole purpose is to spread knowledge? Why, canceling a perfectly legitimate post would be just as bad as deliberately offending people anonymously with insults and overt displays of contempt to the views of others, wouldn't it? Who would be so thoughtless?

I have a tech plus (the very old tech license where you did 5WPM and general theory tests), so, to upgrade all I'd need is code at 13WPM. What method is the quickest and most efficient way to learn it? Assume I forgot my 5WPM, because I did. Just get some tapes or a morse program and run them at 15WPM from teh beginning (idea is to learn the "sound" of each character, rather than "translating a series of dits and dahs". Yes?

I took my Tech at an old dumpy FCC office in New York City in 1976.

Nope, but the CBers took over the 27.405-28.000Khz region so why not the 10 meter band too? There is no FCC, it is a figment of our imagination. If there was a viable Federal Communications Commission they would be making tons of Federal Reserve Notes (not conforming to article 1 section 10) on prosecuting the illegal 11 meter banditos. There is a gold mine there going to waste. Should be proof enough to you that Uncle Sam don't need you or your money, he simply delights in exercising selective prosecution as the whim suits him. Note, the latest Clinton Sex scandal. The local Ham Station here in Indiana is making tons of money on selling Ameritron AL-1200's to local CBers who drive them with new Kenwoods, and Yaesus, and some with filthy dirty transistor amps of a few years back, illegal modulators and such. Wise up get with the program, tear up your license, as long as your licensed your under the obligation to follow the law and jurisdiction of the FCC. Send them a document of recission, buiy yourself a brand new 10 meter CB rig, AL-1200, moonraker and start shooting skip, Boy the solar cycyle is coming up and thats where the action is going to be. Cuss and Fuss delight in your freedom and outlaw status. Hell, have a prefrontal lobotomy and be a real CBer!!!!!

You ever notice how folks with no balls, brains, or ambition sit around and whine and mince excuses after excuses, expending in the process more effort and resources than if they had just got up and preformed. Reinstitute the one year no-code requirement. Advance and upgrade or get the hell out of radio(real radio) and go pick up another hobby more suited to your limited abilities. Write a book on procrastination and get reasonably rich, rape a kid, whatever your personal inclinations are, just do it.

On the other hand most schools systems require foreign language to graduate. Why should they have to learn a language they never plan to use after they graduate. Come to think of it why should they have to take any classes they don't plan to use. Why force anyone to take a math class, science class, or history class if they don't want to. Better yet why don't we just teach them too push the proper pre-programed buttons on the cash register and memorize the phrase "Would you like fries with that order?". Why force anyone to lean english beyond the word "suppressive". After all there really is not a need to have anyone work for something in life is there? There is not reason that anyone should have to put and effort out so they can feel they have accomplished something.

Nobody is holding a gun to anyone's head forcing them to learn CW. If you don't want to learn CW and just work phone fine. Stick with VHF or go to CB.

>Jeff KH2PZ

Whoa.... I am a REAL ("Coded") Technician, have been for over 20 years and I spend a fair amount of my life above 50Mhz. In order to have "control", you not only have to have the numbers but also the origanization (political insiders, lobbyists, etc.) and occupy the majority of the repeater frequency assignments.

I don't believe truly active no-code Technician class licensees are anywhere near having domination in any of the three categories. We share the resources, but I don't think anyone overtly "controls" the spectrum. The majority of the rules governing the hobby have been in place for the good of all long before the codeless licenses were even established.

Don't "give away" something that obviously isn't yours to give, Jeff! <grin> Some of us "old-timers" might have something to say about it!

I could say the same thing about the frequencies below 28 Mhz based on the childish activities I hear on 75-80 meters nightly!

Wow, it is SO simple! Why didn't we think of this before?

Unfortunately, this is exactly what we DON'T need if we are going to
successfully hold on to the "turf" we currently occupy.

Unfortunately, to the bean-counters in Washington, shear numbers speak
louder than quality.

IMHO

When I had a ham license 25 years ago, 160m was severely
restricted in some areas by power and frequency. When were
these limits removed?

This whole discussion is pointless. The code requirement will die with the oldtimers. The average age of opperators on HF is getting older all the time and the number of upgrades is rapidly declining. I'm sure I will hear arguments to the contrary but look at the statistics. Which will die first, the oldtimers or the hobby?
BTW, I am an old line machinist (manual machines, lots of hand work and old world craftsmanship). I now use computer controlled robotic machines to do in minutes what used to take hours. The old ways worked well but have become outdated and obsolete. Time to move on.

Strangely enough, there is some truth in the above statement. From the time I was 13 until I went off to college, I was on CW night and day. My grades were pretty low and I almost flunked algebra and Spanish. My measured IQ in high school was not anywhere near the MENSA level.

Then I went off to college and gave up CW for a number of years. My IQ zoomed upward by about 40 points during my college years. Don't know if there's any cause and effect there, but I suspect in high school, I was operating CW to the exclusion and detriment of more important things.

I might add that there is often good reason to use OOK CW on 160m. True, it can be a more difficult task to communicate via CW but people are not doing it just because they prefer low technology over the so called 'whiz-bang' digital stuff; 160m can be a particularly difficult band to use (high QRN, small antennas with low ERP etc.). CW makes it easier to 'get through' under poor band conditions or equipment limitations etc. when nothing else will. CW is still used extensively on the amateur bands. A few digital affecianados hate to admit it, but that statement is, for all practical purposes, true. Licensees on the ham bands need to demonstrate the capability to make maximum use of the spectrum resources entrusted (licensed) to them, thus they must know CW to use the bands under poor condx. They are not 'required' to ever actually use it, but most end up using it substantially, especially on the lower bands (40/80/160m), when they discover how useful this old reliable mode really is!

>Can someone please describe how the CW exam is conducted.
>Thanks,

On the test I took and subsequent others I've observed, the test is
a 5 minute CW transmission on audio tape. The test taker listens
and writes down the characters being sent. The test taker also
has a 10 question test that asks questions about what was
sent. The test taker can pass the test by EITHER getting
at least 7 questions answered correctly OR having one
minute of consecutive copy 100% correct.

Hope that helps,

Gee, Dyslexia, which make it diffcult (For me and others) to copy
spoken English letter acurately is normaly dealt with by Pychogists
(spelling can also be a problem), who are not empowered to sign the FCC
waivers, which of course for various reasons don't deal with 5wpm
>

Fine I will grant that Morse based CW can be viewed as a digital mode.
Digital modes are normaly sent by machines, such as this one I am using
now. They can also be sent better by machines.

>
> > and even Morse can be better sent by machine

The rules do not require anyone to to be a good CW operator, even if I
manage to beat Morse into my head long enough to survive a code test,
that will not make me one. My computer will still do a better job than
I.

The traditions of American laws perfer to let a Murders go free rather
than condem one inocent man. The FCC as part of the Amercan Goverment
is supposed to be obligated to follow the same principles. Personaly I
would the American Amatuer Radio Comunity would seek to uphold these
priciples. If dispite the "Filtering effect" of CW there is enough of a
problem to merit the attention of a pominant offical(I forget just who's
cal it was that sparked this thread soory) of the ARRL in these filtered
bands, then it isn't working very well, and is violating principles of
the Law besides

Yup. General-class licenses are expiring today. Technician-class licenses
won't start expiring until 2/2001.

>By the way, you should examine the number of Technician licenses which
>have been obtained over the past 7 years, and then compare that with the

>graduate. Come to think of it why should they have to take any classes they
>don't plan to use. Why force anyone to take a math class, science class, or
>history class if they don't want to.

This really gets tiring. Most high schools have a broad array of
choices with only some classes being manadatory for all students.
People not planning on going to college rarely, if ever, are required
to take a language or many other classes that academic track students
are required to take. Even colleges don't universally require
languages, etc.

>Better yet why don't we just teach them
>too push the proper pre-programed buttons on the cash register and memorize
>the phrase "Would you like fries with that order?". Why force anyone to learn
>english beyond the word "suppressive".

The choices for classes are that of parent's and board of
educations. We don't give carte blanche choice to minors
in high school. As to college courses, pick the right college
and you can probably not be forced to take a language.

>After all there really is not a need
>to have anyone work for something in life is there?

Neither high school or college requires any measure of
work. One completes the classes, class work and/or
homework and tests and get graded. For many that is
work, for some its a cake walk. I had a 9th grade algebra
teacher give me a grade of 90 on a reproting period and
put unstisfactory effort in the coments section because
I didn't work hard enough in her vaulted opinion.

> There is not reason that
>anyone should have to put and effort out so they can feel they have

>accomplished something.

Government amateur testing requirements have no place
in even attempting to assess work, effort or dedication which
seems to be the only thing that many CW test advocates
see the CW test as being a yardstick for.

>Nobody is holding a gun to anyone's head forcing them to learn CW. If you
>don't want to learn CW and just work phone fine. Stick with VHF or go to CB.

That's true, until we have the regulation changed.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 27/2330Z JANUARY 1998 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 27 JANUARY AND FORECAST FOR 28 JANUARY - 30 JANUARY
STATUS INDICATORS SOL:GREEN MAG:** YELLOW ** ION: ** YELLOW **

1A. SOLAR SUMMARY
Activity 27 Jan: Low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number for 27 Jan: 101/49

GOES satellite data for 26 Jan
Daily Proton Fluence >1 MeV: 3.9E+05
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 6.50E+05 (normal)
X-ray background: B1.7
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
28 Jan 29 Jan 30 Jan
Activity Low Low Low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 28 Jan: 98/45

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth 27 Jan: Quiet to unsettled

Estimated Indices 27 Jan : A K
Learmonth 10 2333 2222
Fredericksburg 5
Planetary 5

Observed Indices 26 Jan : A K
Fredericksburg 2
Planetary 3 0011 1221

2B. MAGNETIC FORECAST
Date Ap Conditions
28 Jan 6 Quiet to unsettled
29 Jan 16 Unsettled to active
30 Jan 13 active to unsettled
COMMENT: IPS Geomagnetic Warning 5 was issued on 26 January and

is current for interval 28-29 January.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
27 Jan Normal Normal Normal
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
28 Jan Normal Normal Normal
29 Jan Normal Fair Poor
30 Jan Normal Normal Fair
COMMENT: Degraded HF conditions expected for high latitudes on
29 January.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
27 Jan 62

Observed Australian Regional MUFs:
Near predicted monthly values at all
other sites.
Hobart: No data

Predicted Monthly T index for January: 47

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
28 Jan 50 near predicted monthly values
29 Jan 50 near predicted monthly values
30 Jan 50 near predicted monthly values
COMMENT: Mild degradations possible for southern region on 29
Jan.

The adoption of the 10 year licenses has skewed the "count" considerably when you consider if a newby drops out after the first 2 years, or an oldtimer goes SK 2 years after renewal, both are still carried on the active rolls for the next 8 years.

OK...hold on guys! RTTY Sitor or Amtor obeys the same law: The
channel is NOT the center frequency and it will never be
the channel frequency. ITU has indicated for years that the lowest
emitted frequency shall be MARK and be considered the channel frequency.

Why hams cannot get this concept down is really difficult to understand as
the idea has been around for many years. Cliff K7RR

Cutie boy, if bands were taken away simply based on lack of use we would have lost our microwave bands along time ago. How many people do you know who are active on 10GHz? These bands have much more value than a few MHz of HF space.

This is true, of course, but it does not mean that the "deadwood" in each group is the same percentage of the group. In the "entry level" license classes, you'll find a higher percentage of "newby drop-outs" -- they have tried the hobby and didn't like it for one reason of another. The higher class license holders have already lost their "newby drop outs". Those who simply quit at these levels are doing so for different reasons and are much fewer in number than the "newbys".

On the other hand, the generally higher average age of the higher class license holders would seem to result in a higher ratio of SK's from those groups.

The question that comes to mind is this: How does the SK rate of loss in the higher classes compare to the "newby" loss in the entry level classes. Any ideas?

Walt I hardly think Gary is in the dark, your correct about it's
ability to 'get through' under heavy QRM/N but the going doesn't get too
rough on a microwave link to a satellite, no stumpjumpers up there or
liberty net to QRM your call for help, so while CW is still in wide
use in the amateur community. It is fading fast in the commercial
arena. All you have to do is read the trade rags. Morse is being
dropped by all kinds of commercial services.

Might be, Charlie. When I gave up CW my IQ climbed 30%. I had reached the point of diminishing returns with CW and more and more effort resulted in less and less improvement. I turned my attention to engineering where a little effort resulted in massive gains in knowledge and IQ.

That's one of the problems with a skill like CW. One tends to use it to the exclusion of learning anything new and valuable.

2515. New Listserv for "Tornado Alley" SKYWARN.

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-27 00:00:00 UTC
From: Ray Brown <r_brown@getonthe.net>
Message-ID: <01bd2add$9b26eb40$adaf32cf@r_brown.getonthe.net>
Source record: 180325
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur,alt.talk.weather,alt.disasters.misc,alt.disasters.planning,rec.ham-radio

Howdy! It's time to start thinking about severe weather in Oklahoma, Kansas, Arkansas, and Missouri. To that end, I would like to announce the creation of a new Listserv for folks who are interested in, or already participate in, the SKYWARN program in the states of Oklahoma, Kansas, Arkansas, and Missouri. One does _not_ have to be a licensed amateur radio operator to participate in SKYWARN, although "ham" radio does play a major role in getting information to and from the various National Weather Service offices.

This Listserv will _NOT_ be used for issuing any watches or warnings, but rather to discuss what SKYWARN does, information about training classes, and related matters (including discussion of ARES and REACT). Anyone is welcome to participate (subscribe), but this Listserv will concentrate on the 4 central States that make up "Tornado Alley".

To participate, contact the Administrator for the Listserv - me! :-) Send a message to r_brown@getonthe.net and I'll send you the URL information.

Thanks, and 73 (Best Regards)!

Ray Brown, KB0STN
Assistant EC, Jasper Co, MO ARES

stop your whining. theres a law in the works now that will deligate local police authorities the juristiction to control these rowdy cb folks. the fcc did not have the manpower to handle them all. (one quick scan around the 11m band will convince anyone with reason what size task this really is.)

did you ever try to track down a moving signal? i think not.

Hi, Dodo: Why? OOK Morse is too slow, too archaic, too out-moded (pun intended), too much fun (none of which in any way justify retention of the Morse code TEST requirement for HF frequency access licensure), and it is not required to communicate via radio (a situation which logically, horse-sensically, reasonably and pragmatically justifies removing the Morse code TEST for HF freqency access licensure). =0)
Enjoy Amateur Radio! Don't be a LID (Luddite In Denial -- with apologies to Stevenson) -- share all the bands on the basis of RADIO: IMHO, it's the people and the technology, NOT the mode or encoding/decoding schemes, that ARE Amateur Radio.

Source record: 180441

Yes, I think that retesting everyone on a yearly basis is the best
way to clear out the bands......and lets make the requirment of the test
a broken 12 volt power supply with a blown fuse....this would fail about
30% of the "hams" right off the bat.....second if you added a shorted
diode to the test ....anothe 30% would be failed.....and another 10%
would fail from electric shock..(failure to unplug unit).... The other
30%
that could send and copy code would leave the hobby........because all of
the hams they used to talk to would be off the air........

>governmental intervention into the lives of supposedly free citizens.
>You cannot be half fascist and half libertarian.

Why can't I?

I'm not a libertarian, although I'm a governmental minimalist. I'm also
a fiscal conservative. How I reconcile the conflicts is my own problem,
not yours.

Libertarian philosophy is flawed. Unfortunately, man is predatory.
Eliminating all government regulations would create an anarchist
society, not the panacea libertarians claim it would. While many
people would respect the rights of other people, many would not.
Sort of what happens with the schoolyard bully when the monitors
are not around.

I support minimal restrictions on access to guns, primarily
background checks. I also believe there should be a mandated
safety training class all new gun purchasers should take. Likewise,
I believe amateur radio should have certain licensing requirements.

What I do not support are arbitrary requirements, such as
"nobody under the age of 18 can get an amateur ticket" or "nobody
with poor eyesight can purchase a gun". I believe that licensing
standards should exist that give anyone interested an opportunity
to obtain a license if they fulfill the requirements.

This is a fancy LP filter, designed to provide up to 85 DB attenuation over TV channels 2 - 6 and above. Rated at 1 KW full plate modulated AM, and is adjustable both for exact channels needing highest attenuation AND for impedance matched over the range 50 to 72 ohms.

This filter comes in the original box with original instruction sheet. I have scanned and posted the instruction sheet to my web page at

http://www.mines.uidaho.edu/~keng/LF601/

Will sell for Best Offer over $25 or will trade for something interesting.

While you are at my web page, you may as well look at my Schematics pages. Take the link HOME on the LF601 page, and then take the link to the schematics pages. Hope you find them interesting. I REALLY hope some of them will pique your interest enough to make you want to build one or more and put them on the air.

Nat,
Congratulations! Getting on the air will probably
be your best bet to increase your code speed, but
don't completely dismiss the computer either. Both can
work quite well for you. I also remember my first CW
qso's as a novice and the cold sweat too. You will get
over it as you become more comforatable with it. At
least you are willing to work at it and by the sounds

of it, willing to become proficient at it.

I would suspect that the Constitution does speak to the possible
impeachment of the President. It does. Therefore it is possible to say
that the tapes, if illegal (only one party was in MD at the time ...
so i think they are legal) go the the point that the President may
have committed a crime punishable by the Constitution (Bribing a
wistness).

All amateur bands but one permit CW (OOK Morse) operation.
160m isn't partitioned (formally) into separate voice and data
segments as most other HF bands are. Any mode can be used
on any part of 160m. (There are voluntary bandplans in use,
however.) So it is very likely that what you heard was amateur
operation since the amateur service is practically alone in
still using OOK Morse. Virtually all other services have
abandoned it, or are rapidly phasing it out of regular use.

>inflated than any other license class scheduled to expire at the
>same time as the codeless tech license.

Cecil, I will try to explain this. As a "no-code-test" proponant myself, perhaps my explanation would be better received than Michael's, simply because of his perceived bias.

Over the years, there has been a certain percentage of hams who obtain their first license but then find their interest wanes. They find that they do not wish to renew, and so they do not. This point of renewal has not been reached by the newer Tech's, and so there is a percentage of the present Tech license holders who are no longer active or interested in the hobby.

Since most of the other class licenses are made up of those who have passed beyond their first renewal, one may safely assume that these other license classes have already had this non-renewing group removed from their number.

I believe that this is the basis for Michael's observation.

All this should start to even out in a few years, as the non-renewers (first time around) are dropped from the database. After this first round, the percentage of "inflation" should be much reduced.

The fact that the Tehnician class is an entry level license, however, should result in a continuing higher percentage of "drop-outs" than the upper level licenses show.

On the other hand, we might mnake an argument that the upper class licenses also have an inflation factor. If we could take an average age for the hams in each license class, I would believe (no proof) that we would see an increase in average age as we see an increase in license class.

Statistically, this might result in a disproportionate number of non-renewing SK's from the higher classes -- resulting in a modest amount of "inflation" in those classes as well.

In 10-15 years, watching all the data carefully, we should be able to quantify the levels of "inflation" for the numbers in each license class.

Of course, by that time, there should have been a major shift in power . . .

: contributing to the problem. What's the point of having to learn morse?

You are wrong. There are at least 100,000 Hams in the US - possibly as many as 500,000. There are over 1,000,000 Hams in Japan alone.

Why not? Why have to learn any radio theory at all? It certainly is not necessary to operate current radios.

: Do you ever become frustrated because of the
: ridiculously high prices on most amateur radios? It would seem to me, if
: there were _more_ demand the prices would perhaps "moderate"?

Unlikely. The radios are marvelously inexpensive, given everything they do. Compared to modern computers, they are almost being given away.

No, the correct analogy would be...

Why learn a foreign language if you have no intention of ever USING it.
People are FORCED to learn Morse Code to get a certain class of Ham
License, even if they will only be using VOICE!! No one forces you to
learn Russian, if you only plan on living in the US and want to speak
English!!

Saying that someone is LAZY for not wanting to learn Morse Code, is like
saying that everyone in the world (NOT living in Russia) is LAZY if they
don't learn Russian!!

Why waste time learning something that you are not going to ever use?!

Oh Yeah? Most of the astronauts didn't "learn the code" and
they seem to do just fine as amateur radio operators (especially
the PhDs who have forgotten more about ham radios that most hams
will ever know).

FCC database, 411
>internet address database, etc.) you loose all expectations
of privacy. So
>the courts have ruled.

We agree here, Mike. If an individual provides the information voluntarily, he or she has no expectation that that information will remain private. But what about information that is required in order to be issued a license or otherwise obtain permission to perform an activity? This is a hot-button issue right now in states that have recently opened up drivers license and vehicle registrations to the public via the Internet. Individuals are finding themselves being harassed by telemarketers, junk mailers, and worse...stalkers and other criminals, for instance.

Awhile back, someone posted Drew's name, address, callsign, and date-of-birth on this newsgroup. Obviously, they got their information from an old copy of QRZ or similar database, where it was public information at the time. But since then, the FCC has deleted DOB information, due to privacy concerns that were raised. So, would it still be considered "public information" and legally-permissable to post such information?

Mike

Just learn the code as it is and no more. I was taught opposites and
associations and it is causing me nothing but grief.
I am at about 12wpm and soon to take my test but strugling to read at
this speed due to the way I was taught, I keep confusing A's and N's etc.
I think that it would be a good thing to learn code in a foreign
language so that you are not expecting the rest of the word as you do
not recognise it.

Let me know how you get on.
Good luck

>about, and not just so much superstition?

Realize that "every car on the road" does *not* have an airbag, that
airbags are not required to operate an auto, and that airbags have
turned out to have safety problems of their own.

Airbags are gradually being phased into auto use by virtue of new
car sales. No retrofitting is being done. And most importantly, there
is no need for interoperability. If aviation converted their avionics
to a different modulation, *every* aircraft and ground station would
have to be converted at the same time. That's because of the absolute
requirement for full interoperability. The logistics of such a mass
conversion would be staggering, never mind the cost. Likely it would
be necessary to ground all aircraft for a period of some months to
accomplish it. And the first test of the system would necessarily
be a full scale test. There is no assurance that new sorts of EMC
problems wouldn't result from such a conversion. It is a dumb idea,
and the ICAO has recognized that it is a dumb idea.

What is being done instead is to add additional systems to be
operated in parallel with the older systems. And the older systems
must be able to operate unimpaired until every last aircraft and

every last ground station is equipped with newer equipment which has been field proven to have superior performance and less susceptability to EMI. And that means a prudent ban on passenger consumer electronics must continue.

One new system, GPS nav receivers, which are both digital and spread spectrum, has already shown an unexpected susceptability to EMI from certain consumer electronic products, so there is no real assurance that use of SOTA modulations and equipment would remove the need to ban consumer electronics operation on aircraft. The number of possible mixing products from consumer equipment is staggering. If only 50 different types of consumer emitters are on board, there are 3.041*10^64 different possible mixes. And the next load of passengers would bring on board a different mix.

This sort of problem didn't exist in the past because passengers didn't have a wide array of portable electronic devices that they wanted to use on an aircraft. The AM systems worked just fine in that environment, with a proven record of over half a century. It is the relatively recent introduction of a wide array of portable consumer electronics which has changed the situation. And we have no reason to believe that new systems will be less susceptable to certain combinations of them, though perhaps not the *same* combinations which upset the AM equipment. The reasonable and prudent solution is to remove this unnecessary EMC load from aircraft by banning the use of these consumer devices in flight. They are *not* necessary to flight operations, they are merely a passenger convienence. To sacrifice flight safety for passenger convienence would be the height of folly.

>have to use an older radio instead!

The reality is that there has never been a large demand for, or use
of, transverters with HF radios in the first place. And now there is
even less demand and reason for them thanks to the popularity of
VHF+ multimodes and the expansion of most HF rigs to include
6m. The transverter jacks (and associated internals) have become
an unnecessary expense in a market where price competition has
become increasingly cutthroat.

Now I'm not happy about that, because I'm in that small minority
who use transverters, but that's the reality of the situation. To
most purchasers of HF rigs, transverter capability is about as
useful as tits on a boar hog. Those of us who do use transverters
likely have the expertise to modify a radio to work with them in
any event, so the issue is really moot.

Passed my 13 wpm a week ago. I was having the same problem with mixing up the letters, anticipating words etc. What I found that helped me was to get on the air and make at least 1 or 2 QSO's a night. I also would just listen to someone elses QSO and not write it down, just listen and see if I could just understand the conversation. What I found after a while was that alot of the letters I did not have to think about, it just appeared(the sound is the letter) some are still a little rough. When I would copy my QSO's on paper I would just try to forget what the message was and just copy. The on air QSO's also got me out of that "stage fright mode".

Just a side note. Got on the air one night on 75M, called CQ and a local ham that I knew answered. He had a sked with two other hams a little later than when I called and we were in a CW round robin. They were much faster at code but did lower it a bit, but not enough for me to copy easily :) Well I think it helped by stretching me. Had that QSO going for a couple of hours.

That's my two cents.

While I may agree that there needs to be some degree of change to the code requirements for testing purposes, I think that you are all being a bunch of spoiled brats. Aren't there enough things in the world to argue about already? Aren't there enough threats to amateur radio already? Why can't we get together, sit down and discuss the issues at hand without calling each other names and cursing at one another. Act like adults, or this issues (or another issues somewhere down the road) may very well kill amateur radio. Let's have some level headed dicussion about solving the problems that we have. why not propose that the code requirement be dropped for maybe five years, and then see how many new hams are licensed in those five years. Then we can see just how much of a barrier 13wpm code is. That is just one suggestion from a new ham (been licensed a whole 7 months). I'm not saying that this is the proper solution to this issue, just an idea.

I think there is a good argument for dropping the code reqs, but I want my General before the turn of the century, so I'M LEARNING CODE. Maybe if all the no-coders (I don't consider myself to be one) would spend half of their time studying code and the other half looking for logical arguments for dropping the code reqs, the might find that code isn't that big of an issue.

I'll get off of my soap-box now. I have code to learn.

What's that have to do with anything?
We are talking about meeting the requirements to
obtain a Amateur Radio license. Your occupation
has nothing to do with it.

Walt.

Some pretty good stuff by MD cut for brevity as I will only address the following.

Michael P. Deignan wrote:

>
> There is no resistance to change in amateur radio. Amateur radio is many
> things to many people. Some like EME, some like CW. However, we are a

> some of those deal with licensing requirements. Fulfill the requirements
> and get a license. Its that easy.
>
> MD

I dissagree a tad with your statement that "there is no resistance to change in amature radio". Those folks suggesting no more code testing, as a change to the service, is meeting much resistance.

You are correct in that we live by the regs or laws of the country and that is precisely what is being asked for here. Many want the regulation/law concerning Morse Code testing as a requirement for Ham licensing be eliminated. Many, including yourself realize that CW no longer holds the same relevance it did 30 years or so ago.

This whole thing reminds me of my time as a kid in New Mexico. My two brothers and I took on milking cows for my Uncle after we did our chores. Every morning and nite we would go to the corral and try to git it done. But my Uncle kept a pretty tough Bull in the corral with the cows and every time we had to whip the bull before we could safely turn our back on him. I asked my Uncle why it was nessessary to have the bull there and he said, "everybody knows you have to have a bull", and he was of course correct. But, I suggested, why not keep him in another corral, available when we NEED him, and not in our face when we don't. Hell, even the cows, most of them, liked the idea.

Regards,

Ed

Hey Michael,

Do Technician licenses expire at a different rate than General class
licenses? ;-)

By the way, you should examine the number of Technician licenses which
have been obtained over the past 7 years, and then compare that with the
number of new General Class (or any other class) licenses which have been
obtained over the same interval.

Here in Wyoming, you can get 2 sets of plates with the same markings, one set for a car and one set for a pickup (truck) [see www.state.wy.us and have a look at the state statutes for yourself]. Donno anyone that has actually gone off and got call-sign plates.....

KB8UYZ.COM has now changed its site content to focus more on amateur radio news and information. The site will be updated directly from the KB8UYZ Newswire and other sources, to provide you the very latest amateur radio news.

We would appreciate any comments on our new look and features, and certainly would appreciate your news input! If you know of any news that you feel should be on our site, submit it to us, and we will post it!

Thanks again for your visits to KB8UYZ.COM. The site is still available via http://kb8uyz.com.

Well hello there Tim. Please pay closer attention to the callsigns around
here. With a few noteable exceptions, most of us have privileges on
that part of the band.

Point is, there's little difference to the level of rancor there and
here. The high and mighty conduct themselves with equal disgrace on the
internet and on the libertynet.

Forced? I guess we would then have to say they were FORCED into taking a radio/ electronics exam to get their Technician class eh?

> even if they will only be using VOICE!! No one forces you to
> learn Russian, if you only plan on living in the US and want to speak
> English!!
>

No one forces you to learn code either, if you want to do business in Russia learn Russian, if you want to operate on HF below 30 MHz learn code. Seems pretty simple. Otherwise use the 130 MHz of band space above 30 Mhz to your hearts content.

> Why waste time learning something that you are not going to ever use?!

The same could be said for our Universities, as an Electrical Engineer do you really need to know about Eastern Civilizations? Probably not, but your still required to take many electives that have nothing to do with Electrical Engineering. The reason is to provide the Graduate student with a well rounded education. Learning code is in the same genera, You may decide not to use it but you have a knowledge of it nevertheless.
Tell your professor that your entitled to your MBA and you think it's wrong for the University to FORCE you to take a marketing class because you have no intention of ever doing any marketing. See how far that argument gets you.

Hi Mark,Not really, I just don't tend to develop friendships for very long with folks who are afraid to work for something and want every thing handed to them on a silver platter. Granted there are some folks out there that just can't learn CW for some type of handicap and there are programs in place to handle those conditions.

>
>
> Digital pentrates better,

Yep! And guess what? CW is digital. It is a simple reliable digital protocol. It can get through when other digital protocols can't.

> and even Morse can be better sent by machine
> than by people, thus even the uses for morse dont seem to justify
> learning it by hand.

Not really, current use of rtty, packet, and gtor takes a much better signal to noise ratio get through than CW does. In packet modes with error correction the throughput can be almost zero because of repeat packets. A good cw operator can often copy through the noise and fill in lost characters. The human brain is still the best filter of noise and interference in weak signal conditions.

Ahhh, parroting the party line are we. Maybe you failed to see that I said "it does filter at least some of the lids out of the ranks". No system of testing will ever get rid of all of the bad operators. There will always be a percentage of any group who abuse what they have. At this time CW testing does keep those numbers down on hf. All I have to do to confirm this is listen to 11 meters or even some of the operators on two meters. Maybe we do need to address the cw issue at some point, but, before we do, we must find a way to get rid of the garbage on the bands keep it off in the future. Doing anything else will just turn HF into total chaos.

I'm just guessing at this, but I would say that if the information was
public knowledge at the time it was obtained, then it would be legally
permissable.

Here's what I suggest if you *really* want to get on HF and you don't feel
like waiting for the code test to be eliminated:

Take the 13 wpm test. When you pass it and get your ticket, take a sledge
hammer and smash your Bencher keyer paddles in front of the the most
die-hard code advocate you know. This ought to show them what you think
of their antiquated hazing ritual.

The "well-rounded education" argument is the biggest rip-off to come down
the pike since compound interest. It's just an excuse to get a few extra
bucks in tuition out of students who already up to their arses in student
loans.

Bad analogy. When about half the people speak that foreign language,
then that's reason enough for you to learn it. You might not have
any intention to speak that language yourself, but because that language
can be spoken anywhere you intend to go (operate), you should be
knowledgable of it.

Why should I bother then? You'll just it off as a "degree mill" because
it doesn't fit your stated criteria.

That's the bandplan, but it's not reality. I rarely hear any CW QSOs in the
phone portions of HF. The reasons for learning CW are idiotic if you have
no intention of using that mode. 5 wpm should be good enough for anyone,
until the treaty can be changed.

I am sure all the Graduates of Purdue Univerities School of
Science
will glad to hear that. In the three U's I have taken clases, no one
required to take any foriegn language, it an option, and the simplest
one at that, and many do, but one could take a bunch other course and
stay with nothing but english.

And it is mighty white of you to suggest talking about maybe
looking at
CW after you do the impossible, find a way to keep those who create
garbage of the air. CW does not filter anything as far as I can see,
it
reduces the total number of operators, without any asurance that the
resulting ones are "better" proportionaly than population at large.

QRZ!

I'm looking for a manual (copied or otherwise) or a schematic
for a:

Optoelectronics Frequency Counter

Model FC50C

Problem with the prescaler? ANY info would be appreciated & will pay
reasonable cost for copying or manual.
Thank You in advance...

N1FRH

You should be more specific and say that half the people speak that
language, but only in certain portions of the band. They're rarely heard
in the phone sections of HF.

BTW, I passed the 20-wpm hazing ritual, which I shouldn't have had to do.
I don't care if I hear a "dit" or "dah" ever again.

I sadly believe that this is pretty much true. I'm 52 years old and got interested in ham radio when aabout 12. Circumstances made it impossible for me to get much past the SWL and ham wannabe stage until only the past year or so. Now with more time and money I decided to get back in. I found that things have changed a lot. The difference between the guys I knew 40 years ago and the young hams now is night and day. I *finally* managed to learn enough code to get my Tech+ but I found that the written test had evolved into a "baby" test that barely demonstrates ones knowledge of the basic rules. There is little technical knowledge required. It will get easier, too. Now that the FCC has essentially abandoned the airwaves to whatever you want to do, dropping *all* requirements for a license is sure to follow. Then the HF bands will become pretty much a zoo. 40 years ago the foul-mouthed lids who crowd the bands now were never allowed, but who will stop them now? The only bands worth being on will be what little CW only airspace that remains. There the few hams left who are dedicated enough to learn code on their own and get on the air with it, will persist in keeping a small part of ham radio as sophisticated, and gentlemanly, and technically accomplished as it once was. I think that the code requirement should be dropped immediatly, several CW only segments cut out on each HF band, and be done with it. 40 years ago I thought hams were pretty special people, folks to be looked up to, and admired. Many, many of those people are gone now, and not many are taking their place.

2598. Looking for good simplex band (not HF)

Newsgroup: rec.radio.amateur.misc

Hi folks,
I'm studying to get my Tech plus license, and I'm trying to decide what band to operate on. I will probably get a mobile rig to begin with, and I would like to be able to talk at about a 50 mile range, if necessary. Any suggestions on a good band and a good (not too expensive) mobile rig to use for this? Also, is it possible to set up a mobile rig as a repeater, so one would be able to talk through it with a HT? Thank you for any help, and looking forward to some serious ragchewing with you!

Expiration is not a process. Expiration is a date. A single occurance.
It happens on the date listed on your license.

The first round of expirations on codeless techs will not occur until 2/2001.

of their antiquated hazing ritual.

Better yet, give him the paddles and keyer and show him you don't need them;
that you can send decent 20 WPM code with a straight key and copy same in your
head.

It's not a hazing ritual. It's not a connection to "the good ol' days", though
some of us do happen to wax nostalgic over CW. It's not necessarily the most
robust mode either, with Pactor II for one giving it a good run for the money.
But, it is the cheapest, it is not spectrum-hungry, and it encourages
homebrewing requiring only simple designs. It is a good beginning place for
the newcomer. I don't need a $3000 station to copy CW, nor to send it.

If it weren't for CW, I would never have become a ham. Couldn't have afforded
it.

I hate contests, because I find them boring and meaningless as I am more of a rag-chewer. I too sometimes resent the bands being so crowded on weekends with OMs interested only in exhanging the numbers and getting it all over with in a 30 second QSO. Nevertheless, I have to admit it is a valuable tool in building operator skills. Paper-hanging has without a doubt turned many mediocre ops into fairly good ones, so let's not condemn it out of hand.

On weekends, I like 30 and 17, myself. I don't even listen on 20. Try those two bands if you need a little breathing room and especially if you just want a good ragchew.

73, Jim KH2D

This is the way I had it, both when I went to get my original Tech license and when I upgraded to Extra. Come to think of it, my first VE team used a fill in the blank format and I missed out on an original General by one wrong answer. The VE teams have a lot of leeway in exactly how they conduct the exam.

One important detail you whould be aware of: most ARRL VE teams use Farnsworth code, i.e. for 5 WPM the characters are sent at around 18 WPM with the spaces lengthened to keep the actual throughput down to 5 WPM. The ARRL code practice tapes use this timing. Some others do not. Since that is the way I learned, my sending reflects this influence a bit, though most other ops use standard spacing. Most code tutor software, which is IMHO the very best single resource for learning the code, allows use of the Farnsworth technique. It is far easier to upgrade when you learned through the Farnsworth method, since it encourages identifying the characters by their entire unique sound rather than by counting dits and dahs. The counting method falls flat on it's face for most people at a little over 10 WPM and so is to be avoided at all costs. The phenomenon of the 10 WPM "hump" is well documented especially anecdotally by hams who sufferred and sweated trying to conquer it. Save yourself this misery by learning the

correct method from the start.

Contact your VE team beforehand, and they will probably tell you exactly how they will conduct the exam. This will save you any unpleasant surprises. The test is not a trial by ordeal. They WANT you to pass!

Generally, the 20 WPM test is given first, then the 13, and then the 5. Listen to the faster ones and try to pick out the odd letter here and there. This will help get you loosened up and build your confidence. In fact, you may as well go ahead and take one of the faster elements. It is, after all, multiple choice (Usually). Who knows? you could get 6 right for sure, guess on the rest, and odds are one of the other four you will guess right, giving you a passing score. If you have also studied the General Class study guide well enough to pass the written, your very first QSO could be on 20 meters!

The test requirements are pretty liberal. Take advantage of this and try to walk out of there with a General Class license earned. If you don't pass, the tech + will still be a cakewalk.

John
I think you would fine that amoug those who don't want to learn a skill
like CW contain gentlemen and foul mouthed slobs, just like any other
subset of the American Pop. But CW is a mode, and one that to use,
manuauly by ear, and hand has to be a lifestyle. The Idea to leave CW
only sections is fine with me (so long as this used to say open pieces
too small to use, or something like that) and suspect fine with many
people who oppose the code test, not all. However I don't think we will
ever drop all testing for a license. Now as to "bad People" crowding
the airwaves, yes maybe enforcement needs to be stepped up. Not being
on those bands I can't agree or disagree with you as to the need. But
these are seperate issues

as to those who why this is on r.r.shortwave, well take that up with
those who started the thread

17 meters is a fun band to work. I have only had a radio that will work it
for about a month and have found it to be my most enjoyable band on the
weekends. You can actually get a DX contact and really talk to them for a
bit.

But it does not require one to have any technical knowledge. Just about anyone can spend a couple of weeks (If that long) just going over the question pool and become familiar enough with it to associate the correct answer with each question. Try it yourself. After you go through sections a couple of times you even stop reading the complete question. You only read far enough to trigger the association and then jump to the correct answer. Some of the current license manual are based on this and will even tell you so if you read between the lines. It does not prove you have learned anything about the theory involved. When the test was administered by the FCC you had to show the math used to arrive at the answer for questions that required calculations.

What reasons do you give for that CB? I base mine on being able to go to 11 meters or sometimes 2 meters and hear a lot more poor or illegal operators than on HF phone. When I compare it with HF CW the difference makes it almost non existent.

2613. First Two Meter Rig

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-28 00:00:00 UTC
From: bk42047@swt.edu
Message-ID: <886036579.848429068@dejanews.com>

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.scanner

I am new to the world of ham radio and am hoping to recieve my technician license soon. Since I am new to ham radio, I am not sure what brands of radios are better than others and which models are best. I would like to buy a 2 meter mobile rig, preferably one that is under $300 dollars. I have thought about the radio shack htx-242, the icom ic-2000h, the alinco dr-140, and the kenwood tm-261a because they are all under $300 dollars. I was wondering if anyone could tell which of the above listed radios, or any other radio for under $300 would be best for a beginner. Any help or comments would be greatly appreciated.

Thanks

Brian

More or a higher proportion I note that you say CB is wrose than 2M
proof that CW is needed to produce a better operator

> My two cents, again!
> 73!
> Mike in MO.
Mike, Iv'e had more fun working 5 wpm on the novice subbands with
novices &
tech+ operators than I do working the old phartz down at the bottom 25
khz of the bands. I have had the pleasure of having several phone qso's
with operators that I had worked
earlier on the novice subbands. One fellow thanked me for taking a
couple of hours of my
time to help him along. It was great to actually hear his voice after
working him on cw.
There's some nasty curmudgeons on both sides of the code issue that
post their
poison on this ng. Consider the source(s), do what you feel is best, get
on the air with
your 5wpm cw, and have FUN.

73 Tim from Ohio.

2617. FT-MANAGER CRACK

There is more public service communications taking
place on the HF bands than the No-Code CB'ers do
playing around on the FM repeaters.

2620. Renewing Station License

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-28 00:00:00 UTC
From: vandecar@quiknet.com
Message-ID: <vandecar.1.004F111D@quiknet.com>
Source record: 180369

I recently completed the standard FCC form for updating a station address. Upon receiving my new station license, I was surprised to see that my expiration was still only 2 years off. I expected my expiration to be extended for another 10 years. I even remember answering a question as to whether or not to renew the license.

Can anyone tell me the appropriate form to extend the expiration...been out of amateur for several years and now finding the time to return.

Darin

It's also a well-known fact that undergraduate and post-graduate degree programs are constantly undergoing review, analysis, revision, change and improvement. This includes requirements as well as content. Sometimes, one initiates the other; the constant, however, is CHANGE.
IMO, CHANGE is something that is total anathema to the elitists populating the pro-code-test crowd. Why? IMNSHO, the pro-code-test crowd bases and places much, if not all, of the credit for their initial as well as continuing existence in the test. Additionally, it seems that many of those who demand retention of the test are fundamental traditionalists who have "always done it this/that way," who cannot tolerate change -- even when it is for betterment and the benefit of all in Amateur Radio.

Please name a few of the more well-known campuses (you can skip the
"degree mills"), and their justification for dropping such courses.

>Amateur radio would do good to follow this example by doing
>the same with the code test requirement.

Not when about half the QSOs on HF are conducted in code. Remember,
it's the only mode that's allowed anywhere on any band, and it's
the only mode all the world's HF-licensed hams* have in common.
These are reasons enough to know it.

Jeff KH2PZ

*Discounting the restricted, low-power, local-communications only,
CB-like Japanese license.

Hey, no shortcuts on theory, Kevin! :-)
Thanks to all for your kind and helpful replies. I will have to find the balance of a few because some say to "just learn it rote" others have cool ideas about software (which I will get!) and starting at 20wpm, should make for good experimentation and a great challenge, which I love!
And I also am balancing my time between a 15 minute code session and a 35 minute theory study. I do this two or three times a day and feel comfortable on almost all the letters at about 7wpm, and have little trouble with the theory, except for some of the bigger technical jargon which is important, but of which I nonetheless tend to confuse meanings! :-)
Still going, hope to be there soon! Thanks for your help, all of you! I hope I find the majority of the ham world just like this!!!
(Only no AOL commercials and getting bumped off!)

Good point!! MOST classes ARE a waste of time, and they should teach
things that one can USE later in life, NOT History, Literature, or
Physical Education. (I haven't been able to use ANYTHING from these
classes yet!!)

It is being phased out because it is slooooow. Can't send the whole NY Times CW in a few milliseconds. Technically, CW may be pretty primitive, but the question I want answered has to do with content. Most of the "information" I find on the Web and on TV, cable, etc. is not worth the time. In our culture it is 'faster,faster,more,more.' Less is more. Just ask him ;)

> the hams they used to talk to would be off the air........

I suppose if that was to be the case, we could add:

Periodic psychological reviews/evaluations: We don't want amateur
radio operators going "postal" on us!
Periodic medical evaluations and drug/alcohol screenings: We want
fit and sober radio operators that won't come on the air intoxicated
and/or possibly being rendered unfit to operate a radio station due
to some medical or substance abuse condition.
Periodic station and operating reviews: Amateur's stations are
inspected periodically to determine condition and fitness of equipment
in terms of safety, reliability, record keeping, and potential to
cause harmful RFI. Amateur licensees could at any time be recalled
for simulator checks to determine operator competancy, overall
operational fitness, and crisis management ability. Licensees failing
to pass such fitness evaluations would have their licenses restricted,
i.e. limitations on hours of operation, power, antenna F/B ratios,
or operation only under supervision. Licensees who come up to standard
within a given time would have restrictions lifted, those that do
not come up to standard will have their licenses permanently revoked
and will be inelgible from holding an amateur license in the future.
Any amateur radio operator whose license is revoked under these
provisions that also holds any other FCC granted operating authority
such as Marine Radiotelephone operator certificate, GMDSS operator/
maintainer certificates, Radiotelegraph certificates, and General
Radiotelephone Operator Licenses will also have such certificates
permanently revoked unless the individual can present compelling
evidence before a Federal ALJ that such revocations are against
PICON. Any reinstatement would be probationary and subject to peer
review before being made permanent.

.........Fred

I just found this! Jan Axing in Sweden (SM5GNN) has put together a
wonderful resource.

Some GREAT tube data on the web, including characteristic curves for
many types, including:

5AR4 6AB8 6AQ8 6BL8 6BM8 6CA7 6CH6 6CJ6 6CK6
6CW5 6DL5 6DX8 6GW8 6J6 ?807 ?813???6BM8 EC80
ECC85 ECC91 ECF80 ECL80 ECL82 ECL84 ECL86
EL34 EL81 EL83 EL86 EL95 EL360 EL821 EL822 GZ34?
QE06/50QB2/250?? EL34 ECC86 EF97 EF98 ECH83 etc.

All found at:

http://www.algonet.se/~janax/tubedata.htm

Enjoy!

See http://www.mnsinc.com/bry/hamfiles.htm
for a great variety of radio files and information.

Are astronauts really "amateur radio operators"? Sure, they have licenses
so they can operate while in orbit, but how many of the astronauts actually
remain licensed or active after their excursion into space? I consider it
more a formality.

That depends on the VE team giving the test. First, 5 minutes of
Morse code at the speed of the test (5,10, or 20 wpm) is sent, usually
with a tape recorder. Then a written test is administered about the
contents of the test. Ten questions, multiple guess or fill in the blank
depending on the VE team. Seven correct answers usually passes.
One solid minute of copy usually passes too. But it all depends on
the whims of the VE team giving the test.

IMNSHO, anyone who has been granted an Amateur Radio license by the FCC qualifies to be defined as an Amateur Radio Operator. How one operates and how often is up to the individual, dependent upon their situation. Some can handle one station, some can handle ten .... =0)

Hi Bill,And going right along with that reasoning people who want to be on CB don't have to take technical training. People who want to work phone only on vhf don't have to learn code. No problem.

>
>
> The choices for classes are that of parent's and board of
> educations.

So why did my kids always have a list of classes to choose from then? They had mandatory subjects but were usually given the choice of what classes to take.

Likewise, one can choose not to learn CW and work all of the phone they want on VHF.

> As to college courses, pick the right college
> and you can probably not be forced to take a language.

Yep, and your degree will be worth as much as a roll of toilet paper.

> Government amateur testing requirements have no place
> in even attempting to assess work, effort or dedication which
> seems to be the only thing that many CW test advocates
> see the CW test as being a yardstick for.

The current method of administering the theory exam does not prove that the person taking the exam really knows any theory. Go out and look at 70% of the so called license manuals and you will see that they have only the question pool and hints for remembering the correct answer. They do not cover any of the theory behind the test, nor do most give any reference to where to go to get more information. Some of these advertise themselves as the only thing you will need to pass the test. The only yard stick that we have at this time is the CW test that still requires someone to put some effort in to pass. As I have said before. Maybe we do need to address hf CW at some time. But before we do we must get the garbage off of the bands and find a way to keep them off.

I agree. However, would you not also agree that it is valuable to have AWARENESS of the existence of that "worthless information"? This is NOT to say that one must then study that information in detail. If for no other reason, such awareness, simplifies knowing and searching for more, IF and ONLY IF one at some future time wishes to possess more detailed knowledge in a particular area. Comment?

---------- I agree. And congratulations.
It is standard advice that the best and quickest way to build up speed is to
get on the air.

If you are unable to do this then get the study tapes from RS for that speed
and practice 20 minutes three times a day while also practicing saying the
dits and dahs as you drive and see signs, bill boards, etc. Also, make up
your own tapes at various speeds by sending code from an oscillator into the
mic. of a tape recorder and then read the paragraphs at the end of each coded
section. Then put the tape aside for a week or so and use it. This method
gives you an endless supply of practice without you being able to memorize the
material on the tape.

Shortly after Loran A service was discontinued. I don't remember
the exact date, but Loran A has been gone for a long time.

VHF DX'er often seem to prefer using transverters since VHF
transceivers may have low dynamic range and few facilities for DX'ing.
I use FT-902DM with transverters for 6m/2m/70cm/23cm and IC202 for
13/6/3cm SSB/CW.

>mode that will get through when the going gets rough.

Ah, so I suppose that's why NASA uses if for deep
space probes. That's what all those headphone
wearing guys are doing in mission control. NOT!

When the going gets *really* rough, like when Voyager is
reporting back from beyond the edge of the solar system
or when you need to communicate with a deeply submerged
nuclear submarine, uniform symbol length codes and fully
voiced modulations are used. That's what gets through when
nothing else will. In fact it gets through when the human ear
detects no signal at all in the noise.

And this isn't some new space age idea. Nyquist proved it
in 1928, and Shannon fleshed out the concepts in 1948. What
is somewhat new is that we can do it with a few cheap chips
today while it took a room full of vacuum tubes in the old days.

CW isn't worthless. As is commonly noted, it beats analog SSB,
but that is faint praise indeed. When it comes to weak signals in
noise, CW doesn't hold a candle to uniform symbol length codes
sent with a fully voiced modulation. An amateur level example
is Coherent, which uses ASCII sent via BPSK. It works on lower
HF under conditions where OOK Morse utterly fails. And Coherent
is extremely simple and primitive, it doesn't even employ FEC.
The DSP is done in software on a computer as primitive as
an original 4.77 MHz IBM XT (a Z80H could do it without
breaking a sweat if anyone wanted to embed Coherent in
hardware). No special, exotic, or expensive DSP hardware

is required. (Though DSP is no longer exotic or expensive.)

Much better techniques exist, and are in everyday use by amateurs
and non-amateurs. Clover 2000 is an example of the latter. It has
displaced much of the HF maritime CW communications traffic
which hasn't moved to satellite. It is small enough, simple enough,
and cheap enough that any HF radio equipped vessel can afford to
use it. That a few third world flagged vessels still don't is testimony
to their backwardness, not to their perspicacity.

CW will probably be around for years to come in a hobbyist role,
for those who do not wish to do better, but its days as a mission
critical communications method are rapidly drawing to a close
precisely because it *isn't* the mode that gets through when
nothing else will.

Not so. Have your Psychologist refer you to to a Psychiatrist. He or she will be a licensed MD who will be able to sign your code waver. I know a couple people who have Dyslexia and have learned CW. If you would like I will ask them to contact you and maybe they could help you out on this hurdle.

> Fine I will grant that Morse based CW can be viewed as a digital
> mode.
> Digital modes are normaly sent by machines, such as this one I am using
> now. They can also be sent better by machines.

Yes you can send CW with a computer but is it really better? You can also send voice with a computer by using a text to speech program. Is that how you want to work phone? After all that has to be better than real voice because you eliminate room noise or variations of modulation due to the operator's voice patterns.

But sending is only half of the communications link. Receiving is the other half. Most data packages include CW as part of the package. And they all work very poorly at best. Have one bit knocked out by noise, qrm, or qsb and you loose at minimum a letter. More often you loose the sync and then get garbage until the system syncs up again. A human operator has the ability to fill in the blanks when a few letters are missed.

CW is a very simple protocol that gets it's message across because it relies on the humans at both ends to be able to take care of any error correction. To have the transmission mode take care of any error correction a more complicated protocol must be used. Most packetized protocols that incorporate error correction have a lot of overhead used just for the guaranteed delivery. It is not uncommon to see a data packet with only one or a few information bytes while having lots of header and trailer bytes of overhead. If an error is detected the whole packet is retransmitted because the computer, even if it had the ability to tell which character in the information block was in error, does not have the ability to decide which is the most likely character that should go there. In less than perfect conditions a packet may be retransmitted many times which can slow down the transmission rate to a very low throughput.

> The rules do not require anyone to to be a good CW operator, even if
> I
> manage to beat Morse into my head long enough to survive a code test,

> that will not make me one. My computer will still do a better job than
> I.

How do you know if you haven't even tried it? Nobody has to be a good CW operator. Most higher class licenses holders are not good CW operators. So what? However, I would guess that most could get a message through on CW if the need came about and signal conditions were such that only CW could get through.

Everyone's license is expiring today Michael! All amateur licenses begin
to expire on the date they are issued. They all have the same term (all
licenses reach expiration 10 years from the date of issue, and a new one
is issued when a license is renewed), therefore all licenses expire at
exactly the same rate.

Example. Plot the length of time remaining on your ticket vs. time, and
measure the slope of the line. Then plot the length of time remaining on
a Technician's license vs. time, and measure the slope of that line.
Compare slopes. Get the picture?

On the other hand, the rate of _renewal_ for the Tech class can not
be determined due to lack of data. Maybe that's what you've been
trying to say in your previous posts. :-)

Hi there,

is there anyone out there who can supply me with either a schematic or a solution to reprogramm a almost dead prc-68b??

got mine from a fleamarket and it seemed to work alright.
after some serious testing the fault showed up in the upper band from 51Mhz onwards.No output and no receive.No oscilltion....

i figured out, that some code in the eeprom might be missing, therefore i need to reprogramm the unit.Also the unit hangs on some positions of the channelswitch.As it won't accept any changes in frequency.

Hope someone can help me...
If you have anything,pls

mailto:AVICOM@T-Online.de

thanks,

Holger

Morse code.

At least quote me correctly. I did not use the words possibly or precious. Also, I don't see where the two statements are mutually exclusive, since they happen to both be true. I could not have spent the money at the time for the station I have now. The station you describe would not have been satisfactory. Openings sufficient to allow a decent QSO from my QTH would have been pretty hit or miss. between 40 and 15 meters, I had a lot of opportunities, no matter where the ship might be. I definitely enjoyed 40 and 15 a lot more than I would have enjoyed a channel or two of fone on 10 meters.

That is not to say that converting a CB is not a viable option for someone interested in working 10 meter fone. If I were so interested, and I didn't have a rig that covers the band, I would certainly look into that option. But it was no good for me then, and it doesn't interest me now.

For info on VE teams active in your area, test dates and sites, study guides, licensing procedures, etc see the ARRL homepage.

http://www.arrl.org

The other posts are, of course, correct. There are no citizenship restrictions whatsoever. All that is needed is a U.S. address through which the FCC can contact the licensee in a timely manner and where the license can be mailed.

If your friend already has a license from his country, He could also look into a reciprocal operating permit. If his country and the US have a current reciprocal agreement, He can apply for the reciprocal permit and operate using his own license, and use any modes, power levels, and frequencies that are allowed in the US that are also allowed in his native country to his license class.

Given the choice, he should probably go for the full US license, so he doesn't have to use an area suffix after his call, so he can have a normal QSO every once in a while instead of a pile-up, and for a neat souveneir to hang in his shack at home.

Hi Robert,Citizenship is not a requirement to obtain an amateur license in the United States. The license process is the same procedure as for anyone else. If the person has a valid license from their home county they can use that here if there is a reciprocal operating agreement between the countries involved.

About 35 years ago I toured the little museum in Mayfield Kentucky
celebrating Stubblefield. Most of the info came from memories of
that. There was also an article about Stubblefield many years ago
in 73 Magazine. The article also talked about Loomis. As I recall,
his experiments were unpowered and depended on the natural
electric field potential gradient. Amazing the range these guys got
considering how deaf the receivers had to be. Of course manmade
electrical noise was nearly nil back then too.

And with worthless statements like that you shoot yourself in the foot on
any of your pro-code views and come across as just another troll.

From your statement, it is very obvious that you do not do any public service
work. Local emergencies usually highly involve VHF operations and many times
there is no need for HF operations. Larger scale emergencies most often
involve heavy use of VHF for the local communication with HF providing a
backbone contact for medium or long haul.

Take a standard VXO circuit from the Handbook. Now instead to tying
the high side of the tuning pot to B+, tie it to the Data out pin of your
computer's serial port via a 1N4148 diode. The "tuning" pot now becomes
your shift width control. Done.

A variation on the theme is to attach a small trimmer to the high side of
the tuning capacitor of a VFO. Use a transistor switch to tie the low side
to circuit common. Drive the transistor with the data out line of your
computer's serial port. Adjust the trimmer for the desired shift. Done.
At the low data rates commonly used on HF, you can substitute a reed
relay for the switching transistor if you like.

It just doesn't get any simpler than that.

Yeah, but Generals (and all others above Tech) just started expiring for
the first time since 1984 in 1996. That's because the 10 year licenses
started in 1984 and the FCC doesn't purge a station from the database
until after the 2 year grace period. So we've gone a *long* time without
purging the higher class license rolls.

Cecil, you remind me of my younger days and my experience. As a Boy Scout (yea we had em in New Mex) I learned semi-fore with the flags. At the time it sorta facinated me that I could stand on one hill and talk to a guy on the other hill. I even carried a pair of flags on my saddle, was going to warn the town of Indian attacks I guess, but then because dad was doing Morse for his tickets, I started that too. I got up to well over 20 (I was pretty good at it) sending the Montgomery Ward Wish book. Like a drummer I did it on everything and it was in my head all the time. Even when milking cows it had to be in OOK. One nite while milking one of the mildest cows we had, she kicked me the bucket and the stool I was on back on my head. I looked up at her and she was just staring at me. I looked at the rest and they too were staring. I got the message then, NOOOO MOOOOO OOOOOK on my things.

BTW, I now see girls at football games with only one flag and their messages look much better than mine. So now I have given it all up.

That "sideband" as you are calling it *is* the image. This is completely
separate from *modulation* upper and lower sidebands. A receiver with
a plain mixer will output at the IF a product for RF inputs corresponding to
LO+IF and LO-IF. One is the desired signal, the other is the image. Now
an image reject mixer is configured to only output one of these products.
This is *not* done by preselection filtering. While that will keep undesired
RF signals at the image frequency out of the IF, it will not keep *noise* at
the image frequency out of the IF.

An image reject mixer uses a phasing technique, identical to the phasing
technique used to generate single sideband, to cancel the undesired image.
This also cancels internal receiver noise at that frequency. So for receivers
whose SNR is set by internal noise (most everything at VHF and above), the
image reject mixer gives a 3 db better SNR than a plain mixer.

I am just starting to learn code. Since I am being told that 5 wpm is not actually morse code, is there any reason why I should not START learning at 13 wpm or even faster? I have a computer program that is designed to teach code (using the Farnsworth Method) and it lets me set the speed that I want to work at between 1 and 40 wpm. Just wanting to know before I really mess something up.

73,
John

Walt, you flat don't understand the point. This is understandable as
there is evidence OOK can adversly effect your mental capabilities if
used very often. You seem to be saying "No Change, No Change" and you
should know that with no change your hobby would be in the dark ages
which is where you may be if you only endorse OOK.

In September of '89, Hurricane Hugo hit South Carolina on a weekend. Your
so-called "Highly trained" operators were more interested in racking up
multipliers for some state QSO party than they were in helping relay messages
from the disaster area. I had trouble hearing stations from South Carolina
because of idiots calling "CQ contest" on top of them.

Gary,

I think you are a victim of your own Yankee propaganda.

You are one of the people who think the Japanese never invented anything but are very good copiers.

Wake up to the obvious facts. Obvious to the rest of the world if not to you.

Have a good look under the bed. Any Reds?

Of course not!

Who was the first man in space?

- and all the tens of thousands of other instances.

Reg.

Very true. This is one reason I suspect we will start to see a decline
in the number of licensed amateurs in the US. I also do not think that
the decline is necessarily a bad thing, given our numbers have been
artifically inflated for the past decade.

I am looking for either a Kantronics Hamtext cartridge or an AEA
MBA-TOR cartridge for the Commodore 64 computer. I would also be happy
just getting a copy of either program on a commodore floppy disk. I
want to get my old C-64 back running for RTTY use. I am also looking
for an AEA CP-1 RTTY interface with manual. Would also consider a
CP-100. Please reply via email.

In 1972, pre-HT days, I had a "Doublehandful Talkie", a Drake portable known as a TR22, one and a half watts, rigged for both portable operation with it's internal telescoping 1/4 wave whip and also used it as a mobile rig with a 1/4 wave whip mounted on the luggage rack of the station wagon. No repeaters in the area then,(very few anywhere) and all 2 meter work was simplex.

One day while out driving I heard W2SKE calling QRZ on 146.52 simplex. I called him and he came back to say that he was on an airliner at 33,000 feet 30 miles east of Dallas, Texas enroute New York City and he was using a rig identical to mine, while holding the antenna up to a window. He would have been at least 200 miles from me. The contact lasted only a few minutes before he dropped out but it was full quieting for that time. (this was in the days before the ban on such activity by passengers). He didn't say, but I'd bet he was seated on the side of the plane facing me. Like you, I would have expected the fuselage to be a pretty efficient screen room.

I recognized the callsign W2SKE, it was Bill Leonard, a well known radio and TV journalist, now SK. I'd heard him and read about him in the ham magazines.

I was always amazed at the distance I was able to work with the little Drake on simplex. Once I was on an automobile ferry crossing a lake about 80 miles from my hometown, when on a whim I gave a simplex call to a friend who I guessed might be on his base station, never expecting an answer. He came right back, near full quieting. The lake was 800 feet lower in elevation than my friends station and in hilly country, though he was using an yagi on a 60 foot tower. I still marvel over what we did in the pre-repeater days on 2 meters.

By all means, start using the Farnsworth method, with character speed set to 15-18 wpm. You are fortunate to have this method available, it will speed your learning considerably.

Typically one learns the letter/character sounds at very slow speeds and slowly advances the speeds as he practices. Usually one hits a 'wall' around 10wpm that seems difficult to overcome. I'm convinced that this is because one must 'unlearn' the character sounds for slow apeed and 'relearn' tham at a faster rate. If you START at the faster rate the advantage is clear.

If you have a problem recognizing the characters at the speed you select, and cannot resolve it with some practice, reduce the speed some and try again.

Congratulations and good luck,
Dick W0EX

Charlie, all that makes good reading if one holds the preconceptions
that "avoidance of change" is the force driving the pro-code established
group.
Unfortunatley for your story, it is based on whim and not fact.
The "change" you have in mind is the elimination of code in ham
radio--yes I know you are saying "no, only the test". But eliminate the
test and eliminate the code. Not today, but too soon. That's what we are
fighting, simply because we are even more convinced that we are right
then you seem to be in you holy war.

Hi Robert. Not only can foreigners get a U.S. licence they can get it in
any country where there are VEs. The only proviso is that they must have
a postal address in the States, yours will do. I took mine in the wilds
of Yorkshire, England.

Best wishes

John:

Don't listen to the Boy, he isn't a Amateur Radio operator.
5wpm is every much CW as 40wpm! After you learn the code,
get on the air and work as many stations every day to help
build you speed. Being on the air will build speed faster
than and tapes or computer programs. Even though I spend
99% of my time on the Extra portion of the CW bands, I go
to the Novice bands to help new CW operators gain experience.
Even though you are new and sending at 5wpm, you far outshine
any No-Code Tech!

Walt.

> is solved.

You say that because you don't understand the benefits of contests.
Only the most efficient and robust equipment installations, from
radios, operating position, lead-in, to antenna, can be a serious
contender. Here, you'll find only the very best operators, knowledgable
of propagation conditions, international procedures, and operating tech-
niques who, when hearing something as simple as a single "dit", know how
to interpret such a cue.

These exceptional operators and the rock-solid stations they operate are
whom your community turns to when disaster strikes, for these communica-
tors voluntarily "train" themselves weekend after weekend, in the most
grueling mental and physical activity known to the amateur radio service.
No other operators are better prepared for the rigors of providing
emergency communications.

2725. IMAGE reject mixers?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-29 00:00:00 UTC
From: electron78@aol.com
Message-ID: <19980129060001.BAA10405@ladder02.news.aol.com>
Source record: 180240

I am a little confused as to what image reject mixers are capable of doing. Do they just reject a receiver's incoming image frequency from a signal that is at LO+IF, or do they also reject the undesired sideband when mixing down to the IF, such as the upper sideband (LO+RF), and keep the desired sideband (LO-RF)?

Many Thanks!

Mike

I dunno, seems I spend a lot of time answering questions about my part of the country, my job, places I have been, even (gasp!) politics on extremely rare occasions. I have learned a lot about parts of the orld I have never been, too, and ways of life or jobs I would otherwise know nothing about.

UR right abt the WX. I don't really see what it matters. I like to break the ice talking about equipment, band conditions, etc. and I genuinely enjoy discussing antennas etc. Most hams do. I learn a lot about new techniques and design from other hams OTA. For Instance, it was an OM in Ecuador who first described the Hamcomm interface to me and sent me scrambling around for a copy of the program.

Exchanging MEANINGFUL RSTs is productive as transmit power, beam heading, etc can be optimized for conditions. I think a simple "QRK5" etc should be sufficiently detailed report for good RX, though, and these days we could well drop the "Tone" number alltogether.

You can't extend the expiration. You should file your 610 abt. 90 to 60
days in advance of your expiration date for license renewal.
Whenever you have a change of address, change of callsign etc.. the
expiration will stay the same.

??????? 'Fraid not, James. *No* technician licenses will expire until the first one has been issued for ten years, *then and only then* will they begin to expire at same rate as all others have been and still do.

Only at that time will the statement 'all licenses expire at the same rate' be valid. They must *begin* expiring before the statement can be valid.

How many Generals expired this week? How many Technicians? Same rate?

several of us.

What good does it do to have a throughput of a kilobaud if I can only type
about 35 WPM? Computer-assisted digital modes are indeed superior for handling
messages, but the extra throughput is waaaay overkill for casual ragchewing.

Bandwidth is the benchmark for that
> But, it is the cheapest,

Sorry, but I'll pop the extra

Not all of us have computers... all of us hams, that is.

Get over the hang=up of "copying by ear" ... it's most
>inefficient.

Doesn't seem inefficient to me. I hear and I understand, as long as the other op stays below 30 and sends decent code.

> it is not spectrum-hungry,

It is clearly not the most
>spectrally efficient mode available.
(The only VALID metric for spectral
>efficiency is bits/sec/Hz,
not just raw bandwidth ... and remember that if we
>slow better
digital modes WAAAAAYYYYY DOWWWWN to Morse thruput rates,
>they'll
take less bandwidth than Morse, too.)

Say WHAT? how do you figure less bandwidth? There are at least two distinct tones used, no matter how narrow the shift, so while it can indeed approach CW in narrowness of bandwidth, I can't see for the life of me how it could surpass it.

> and it encourages
>
>homebrewing requiring only simple designs.

Adding a 15-20 cent varactor is
>NOT a BFD in terms of complexity.
This argument for OOK Morse has long-since
>worn out ...

As a matter of fact, on the simplest of CW QRP transmitters, you will be nearly doubling the parts count, and requiring interfacing to a computer.

> It is a good beginning place for
> the newcomer. I don't

>need a $3000 station to copy CW, nor to send it.

You don't need a $3k

afforded
> it.

Learn to scrounge better and
>upgrade your station to this century's level
of technology ... you might even
>learn some things in the process (and that's
the primary purpose of ham
>radio).

As a matter of fact, almost everything I have ever built has been largely with scrounged materials. I learn something even if I'm just building a new key or troubleshooting a power supply. My technology IS this century's technology. What century do you think CW was invented? or the Sperhet receiver? DSP? Even my keys are built with modern materials when appropriate.

I am not prejudiced against ANY mode. I have a computer, and I have worked several digital and a couple of image modes. I enjoy it, too, but I really like CW. You, on the other hand, seem to have a manic hatred for CW. instead of looking for common ground, you zero in on CW as a divisive issue.

By the way, the varactor for FSK is a pretty neat way to go, I'll give you that. I have often mulled the same idea over but haven't actually tried it yet. But for a first project, I would still recommend a simple crystal controlled single stage transmitter with minimal parts count, using discrete components for clarity. I'm afraid that still means CW.

If you think of any potential pitfals with the varactor FSK thing, which I assume you have used, fire me an e-mail if it is convenient. I don't remember ever seeing anything published on this. Actually, a complete project article would probably go good in QST.

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK
>TOUGH!!"

10 meters wouldn't have done me much good, Drew. I needed a long-haul band as I spent a lot of time at sea. I didn't have access to garage sales either, nor have I ever seen a $5 CB. With my homebrew rig I had 15 in the afternoon and 40 in the evening and morning, and my little pebble-polisher did make a lot of near-transatlantic contacts before I graduated to a 100 watt allband wonderbox. Furthermore, with the resources I had at hand, it was still easier to build a transmitter than convert a CB. Cheaper, too, in the case of the old crystal controlled CBs. Also, I wanted to do more with radio than just pick up a mic and ratchet jaw with all the good buddies, and what fone traffic I heard in my pre-license days sometimes didn't appeal to me. CW was not particularly hard to learn, either, though I admit that the elusive 30 WPM barrier is gonna be a long struggle for me, and I'm not certain now that even if I had the time on my ticket, I could get a minute of solid copy at 25 for my 1st Class ticket.

I guess you think converting CBs to 10 is a more useful skill than CW or the ability to build oscillators, PAs and filters from scratch?

Admit it. You're prejudiced against CW because you had a tough time with it. Unless you have a learning disorder of some kind, the right approach will make a lot of difference. You probably just got steered in the wrong direction and learned using the "count' method. Download one of the many shareware morse programs and mess with it using the Farnsworth-style timing. You don't have to tell anybody... you can keep it a secret if you don't want anybody to know you are finally taking your medicine.

It's not a private club. ANYBODY can get a license. You don't have to be a citizen. you can be blind, deaf, whatever. There are no age limits, You have a license. If HF were my private club, do you think you would have a ticket? You studied and learnt the code. You earned your license the same way I did. If you did it, Drew, nobody can use the excuse that it is too hard. Pretty cosmopolitan bunch, us hams.

2736. ham licenses for international students

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-29 00:00:00 UTC
From: rah1@hopper.unh.edu
Message-ID: <slrn6d0f7p.7hl.rah1@hopper.unh.edu>
Source record: 180251

Hi...thought I would post this & see if anyone might be able to help. I appreciate any info. I have a good friend who I would like to introduce to ham radio. My friend is a graduate student from China. Can a foreigner apply for a ham license here in the U.S? If so, are there any unusual procedures? Or does she have to apply for a license given by her home country? Anyone know?

Thanks and 73,

KB4ZGU (Robert Herschbach)

You can be aware that something is worthless without having to study it
for weeks!

It only takes a few seconds to know if something is a waste of your
time.

And actually, it is not even a language, just a more slow and
complicated way to speak the SAME language! It would sure suck to have
to talk to someone on the telephone by only using the touch-tone keypad
to talk letter by letter in code!!

cosmopolitan bunch, us hams.

You don't get it, do you? The point is that the testing requirements must be relevant when it involves authority to do something as granted by the government. Morse code is no longer relevant. Ultimately, the code issue will end up in the courts and will likely be struck down as a result of this.

That's not what you said in the previous post. You said that you just couldn't possibly have afforded to get started in ham radio, if not for that precious Morse code.

>I didn't have access to garage sales
>either, nor
>have I ever seen a $5 CB.

I've seen plenty. Some as low as a dollar or two. People have them sitting in their basements or garages and just want to get rid of them. I have picked up SSB rigs for as low as $5, with PLLs that are easilly modifiable for freeband and/or 10-meter coverage. You really need to get out more.

All the student needs to do is take the appropriate U.S. amateur exams and s/he will get a U.S. license. There is no requirement to have a license from the "home" country. A stateside address for the U.S. license to be mailed to is required. Contact your local VE team for more info.

They ALL work very well! I'm sure someone will tell you this radio or that radio is better. Its been my experaince that the makers of commercail ham gear all have a fine product. Just pick the radio with the features and a price you like. Radioshack has one advantage in that you can just walk the radio into a local store for repairs. 73 DE N8XYN

>Only the most efficient and robust equipment installations, from
>radios, operating position, lead-in, to antenna, can be a serious contender.

I'm sorry Jeff, I have to disagree with you.

In most respects, contests are little more than a dick-size war. Serious contesters spend tens of thousands of dollars on setting up elaborate stations with SOTA radios, amps, towers, etc. "Joe Ham" can't compete, that's why if you examine the "results" section of QST you'll see many of the same callsigns over and over again. For instance, here in RI we have one guy (KM1X, a fellow member at W1AQ) who is *always* in the top finishers for RI. Another club member and serious contester, W1RR, just spend major dollars setting up a new contest center in his basement. Yet another very good friend of mine (NM1Z) lived in DC for a couple of years, and has told me several times about a fellow in MD (can't recall the callsign) who has a "contest center" -- a building with several 200' rotating towers, stacked yagis, Alpha amps, etc. Regardless, my little FT900 barefoot into a dipole ain't gonna compete.

For the most part, I despise contests, although I usually participate in them for a short period of time, to give people a chance to work a RI or HI station, depending on where I am anchored at the time. I certainly would never consider eliminating or restricting them. However, I do think that contest promoters should have "proctors" monitor the bands during major contests, and disqualify or deduct points from those operators on the bands who operate discourtiously.

2757. Retests and CW/CB

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-29 00:00:00 UTC
From: tech <tech@dp.net>
Message-ID: <Pine.BSI.3.95.980129104141.18740A-100000@home.dp.net>
Source record: 180272

I have an idea.......

Why not just eliminate the Ham and CB bands altogether and then MAYBE we can talk about something a little more important. This then JUST MIGHT end the continuous thrashing of insults and blame back and forth between CBers, Hams and those who dislike any facet of either function, be it CW or whatever.

No retest is going to cure ALL, if any, of the problems. It certainly won't take out the "crazies" who willfully and defiantly go against all rules. So, either we learn as a radio society to live with each other, or someone else be it the FCC, big business or who ever or a combination will end it all for us. Can't we just enjoy the hobby and try to get along???????

As they say, money talks and bull shit walks. And all of the problems, fighting, casting blame, cheating on exams, not respecting the rules of the land so far as radio, etc, is nothing but BULL SHIT.
WE better enjoy it, while it's still had to be enjoyed. And as we all know, there are those, who are at this very moment, working towards an end to the hobbies to an extent. So we better wake up BEFORE it's too late.

I am a Ham operator. Once proud of the hobby, but dismayed over the dismal outlook. I am also a past CBer. I left that band because all I ever heard when I turned it on toward the end was, Hey John I'm coming over there to kick your ass, and so on and so forth. Nine times out of ten, the parties were drunk or sure sounded like it. I bought my radios to talk on, not to hear a night at the fights via radio. And the worst part is, it was like being chained to the same channel, as that's about all you hear now a days. In the last week, I turned on the CB after about a year. AGAIN, all I heard was threats of people doing harm to others. It hasn't changed.

Come on people........ Lets start acting like humans with intelligence. If any aliens heard this stuff, they'd have no problem knowing or thinking, we have NO INTELLIGENCE. There is a lot of radio spectrum to be had and enjoyed, if we just learn to appreciate each other and mind the rules. Instead of drawing a battle line, this is a hobby, which SHOULD be viewed as a MUTUAL INTEREST. WE MUTUALLY can save and ENJOY the hobbies. INSTEAD of destroying them as we are.

If you think radio is bad, Internet is next. Look at how many people are sending Spam XXX e-mail to all N.G.s. It isn't needed or wanted, by most. And, kids, women and even men to some extent aren't safe on here anymore. That is a proven fact. So, unless we start acting as a civilized society, whether on radio or computer, where ever, we are ALL in trouble. These atrocites can only spell restrictions if not deletions from our present

right(s) to have these hobbies/interests.

Just an opinion.

IF you disagree, save your flames. Everyone is entilted to their own.
If you agree, then pray for a better radio/computer tomorrow. WE'll need it.

Tech@DP.NET

Yes, this is the same question that gets posted every few weeks.
This time, however, I am going to take the replies and put
them on a special page at my Web site. (I am collecting ham
folklore.)

So, once again please: What are the origins of the term "ham"?
If you can include your source it would be helpful. All stories
and their variants (except the patently ridiculous ones) will
be greatly appreciated.

Ever wonder why they would be getting rid of their CB for a buck? Probably because they turned it on and found it was totally useless because of the local lids on the band. Heck a dollar or two is still 10 times more than what it is worth.

> People have them sitting in
> their basements or garages and just want to get rid of them.

Which just shows you that they have good taste. Heck CB maybe the availability of so many cheep, used, CB radios in your area has something to do with your operating style on CB?.

So tell us O wise and all knowing CB, just what are the members of this private club doing to prevent you from learning CW? Are they focusing some kind of mind numbing brain wave at you that erases your CW learning abilities? There is nothing any hf operator can do to prevent you from upgrading and using hf. Your private club theory just does not exist.

In fact you are probably the proof that CW requirements do act as a filter.

Heck, if you think you have the "right" to use any public frequency then why don't you just start transmitting on your local public safety frequencies and then tell those big men in blue suits with big sticks about your rights...

Hi all,
I'm looking for recommendations/ comments on any software designed
to use the CAT function of the Yeasu HF rigs(mine is FT-840). It would
be nice if this control software also functioned as a DX logger. Any
such animal out there?

Thanks for your help.

That's strange. In the 35 years I have been working I have found that the most successful people were the ones who had an expanded education with a wide view and range rather than one based on tunnel vision. How sad to have to miss so much in one's life.

If the only things that you should learn about are those related to your work why are you interested in ham radio?

Yup, I have already heard if from a few. They argue that with today's modern HF rigs there is no longer a need for theory because, other than setting a power level, they do not have to "tune" the transmitter.

>I didn't read was what are the low tech solutions to low SNR communications?

Coherent is low tech by today's standards. It only requires what amounts
to downright primitive equipment.

>Should Morse code be replaced by anything that a human with a simple radio
>transmitter and an even simpler radio receiver can use.

Realize that the simplest practical transmitters for OOK Morse
can also be used for FSK with only the most trivial of modifications
(a shift capacitor and keying transistor). And any receiver practical
for copying OOK Morse can also copy FSK. And it has been proved
that, when sent slowly enough for manual human interpretation, FSK
is more reliably discerned by ear than is OOK. Early arc transmitter
operators did this because making and breaking the arc wasn't
practical, so they FSKed it instead. Even when using Morse, FSK
is better than OOK. Today's amateurs generally don't know that
because they've never thought of doing it.

By ear copy of uniform codes is also possible. For example, I can
copy some words and phrases sent in 60 WPM Baudot by ear simply
from long exposure to RTTY. If sent more slowly, and if one had good
reason to practice, there's no reason it couldn't be solid by ear copy.
Of course machine decoders are even better, and much faster, and
can also be quite simple. The simplest high performance decoder is
the old Hoff TU from 1963. It uses 88mH toroid passive filters and a
simple 12AT7 vacuum tube slicer. Today we'd use a garden variety
opamp for the slicer. This unit is about 70% to 80% as good as today's
DSP units at a fixed speed, and that still makes it better than what can
be done by ear. But we can do DSP with as few as 2 chips, and that lets
us dynamically adapt to channel conditions, so there's no reason not to
use them instead.

>When the fecal matter hits the impeller KISS is best.

That's often true, and the most important thing to be KISS
is the most unreliable component, the operator as decoder.
Fatigue, stress, and injury can cause operator performance
as a decoder to deteriorate dramatically. Machines don't
become fatigued, aren't subject to stress, and have infinite

patience to deal with any poor communications channel.
They are better than the human operator is at his best.
They also allow those without much training to use them
effectively in situations where the primary operator may
be incapacitated. This can be critical in an emergency.

Machine decoders are at least as reliable as the radios
to which they are attached, and as easily repaired if
necessary. The same can't be said in general about the
operator. His wetware modem is exceedingly complex.
Our best neuroscientists don't fully understand how it
works, and are frequently unable to affect repairs on it
when it malfunctions. We do understand machine
decoders, and we can repair them if necessary.

>If you feel this question is worthy of response and will enhance the
>dialogue feel free to post it to the group.

It has all been said before on the groups, but it bears repeating.

>I for one as a Tech No code, with aspirations for HF privilages don't
>feel held back by the code. I am very glad that there is a no
>code entry point. I wouldn't be an operator with out it, and at the very
>least I am a voice helping preserve frequency allocations.

Indeed, and at least some of us are happy that you've had the opportunity
to become an amateur in that fashion. Realize that wasn't always the case.
A number of us fought for a decade to make it happen. Its fine that you
don't find code speed testing a barrier to full amateur privileges, but
many do. Now if there were any reason to believe that Morse speed was
essential to being a full privilege amateur, I'd say "tough" to those who
want to avoid it. But that isn't the case.

There is no compelling reason remaining for an amateur to be able to
receive Morse at a certain speed. Once, a very long time ago, there was
a compelling reason. That was interoperability with life safety stations
sharing our allocations who only used Morse. Amateurs needed to know
Morse so that the life safety stations could tell them to QRT when they
interfered with life safety communications.

But life safety services don't use Morse anymore, and they don't
share frequencies with amateurs either. So the rationale for the test
requirement has become a moot point. Morse speed testing no longer
addresses any compelling government regulatory concern. And its
testing has become a regulatory artifact which needs to be removed.
Morse is just one of many modes an amateur may voluntarily choose
to use. And if he chooses to do so, he perforce must become competent
in its use. No formal test is required, only the real test we all pass or
fail every day with any amateur mode, that of making a contact on the
air.

I'm not surprised. Russia is a third world economy which attempted
to field a first world military. But aside from the trappings of nuclear
weapons and missiles, it never succeeded. Much of its infrastructure
is still primitive. They even still make vacuum tubes over there. But
they do know better. Some of the best data algorithms have come
from Russians. They just don't yet have the microelectronics
infrastructure to field them properly on the necessary scale. We
don't have that excuse.

The 219 MHz amateur band is restricted to point to point data emissions
only.

Well, for one thing when you listen to the 80 meter trash operators you are hearing most of them in the whole country. When you listen to 11 meters or 2 meters you usually only hear the local yokels. I really doubt there is anyone here that can prove that there local 11 meter band has fewer lids than all of the 80 meter trash gang. Unless of course they live in a rural area that has very few CBers or hams in the first place.

>they begin to expire at same rate as all others have been and still do.

Everyone's license expires after 10 years Dick. Most obtain a renewed
license within 60 days of the end of that term. The renewed license is a
new license with a new expiration date, and it expires at the same rate
as the old one.

> Only at that time will the statement 'all licenses expire at the same
>rate' be valid. They must *begin* expiring before the statement can be
>valid.

The term of license can be viewed either as a step function (which is the
only way you and MD evidently are able to view it), or it can also be viewed
as a ramp function, as I suggested in my example. It was MD's use of the
expression "expiration _rate_" which implied the latter, and lead me into
this discourse.

Either a license begins to expire on the date it is issued and expires at
a constant rate until it's term is complete, or it's term is put on hold,
and the entire 10 year period is compressed into a single instant of time
at 12 midnight on the date of expiration. It has to be one way or the
other (and the latter seems the less likely of the two).

This was really just an exercise in semantics and mathematics - an exercise
in which you and MD have not done particularly well.

>How many Generals expired this week? How many Technicians? Same rate?

I don't really follow the obituaries much. Kinda depressing to me
sometimes. Prolly the oldest guys expire in the greatest numbers I should
think. I suppose their individual rate of expiration could be determined
by dividing their age in years at the time of death into 1, resulting in
units of life/year. Their licenses all have the same expiration rate
though. The rate of expiration of an amateur radio license is .1
license/year.

It's a joke man! I'll bet you guys are a real riot at parties.

There is a lot of memorization done to first learn the code as in a lot of things we learn. But at least after you do this you will be able to do something useful with the knowledge such as receive a message sent in CW.

Please tell me how memorizing the correct answer on a question solving the phase angle of a series XC, XL, R circuit is going to help you later when you need to find the phase angle for another series circuit. Memorizing the answer does not require you to know anything about the formulas used or the theory involved.

You can't extend the expiration. You should file your 610 abt. 90 to 60
days in advance of your expiration date for license renewal.
Whenever you have a change of address, change of callsign etc.. the
expiration will stay the same.

> some of us do happen to wax nostalgic over CW.

Sure it is ...

> It's not necessarily the most robust mode either,

That is quite clear and quite correct ...

> with Pactor II for one giving it a good run for the money.

It's not a question of "giving it a good run for the money."
Pactor II (and Clover, and even simple BFSK) can handily
kick OOK Morse's ass in terms of spectral efficiency and
weak signal performance. That has been proven MANY, MANY
times through simple analyses presented in this forum by
several of us.

> But, it is the cheapest,

Sorry, but I'll pop the extra 15-20 cents for a varactor and
do BFSK/MSK with the same simple rig. The receiver is no more
complicated, and I already have several computers on my (home)
LAN which could easily do the encoding and decoding (including
FEC) that will easily blow away OOK Morse ... not a bad investment
of that 15-20 cents, I'd say ...

Get over the hang=up of "copying by ear" ... it's most inefficient.

> it is not spectrum-hungry,

It is clearly not the most spectrally efficient mode available.
(The only VALID metric for spectral efficiency is bits/sec/Hz,
not just raw bandwidth ... and remember that if we slow better
digital modes WAAAAAYYYYY DOWWWWN to Morse thruput rates, they'll
take less bandwidth than Morse, too.)

> and it encourages
> homebrewing requiring only simple designs.

Adding a 15-20 cent varactor is NOT a BFD in terms of complexity.
This argument for OOK Morse has long-since worn out ...

> It is a good beginning place for
> the newcomer. I don't need a $3000 station to copy CW, nor to send it.

You don't need a $3k station for better things either ... with some creative construction, parts scrounging, etc. a suitable station can be assembled for very little ... in fact, XT/AT and even 386 computers that would be quite capable can be had in many areas simply by "dumpster-diving" in industrial parks, as businesses upgrade to new Pentium machines and to software that requires a minimum of W95 and a 486/Pentium CPU.

> If it weren't for CW, I would never have become a ham. Couldn't have
afforded
> it.

Learn to scrounge better and upgrade your station to this century's level of technology ... you might even learn some things in the process (and that's the primary purpose of ham radio).

Yrac observes:
Compound interest has been called "the eighth wonder of the world." It can make your money double in just a few years. At the same time, using a "banker's secret", you can keep it from working against you on your home mortgage. I regularly show folks how to save hundred's of thousands of $$$$ by making a simple change to the way they make their house payments.

(Just wanted to slip that in.....now back to the original topic).

Dr. Bellows wrote:
>
>Exactly!! Being an expert in one area that is USEFULL, is a lot better
>than being "well rounded" in a bunch of worthless information that can
>not be used in real life.
>

Many decades ago, I was a freshman at a large university which had a great school in my target field, Radio, Television, and Motion Pictures. I was "chomping at the bit" to get into some of these special courses. I complained to the head of the department about being stuck in the general courses required of underclassmen.

His response was, "Son, I'm a lot older than you, and I have taken many courses of all kinds. And what I want to share from my experience is that NO course, not matter how non-revelant it seemed at the time, has been a waste. Somewhere, somehow, I have used each and every one to my advantage."

In the thirty-plus years since he told me that, I have seen how true it is. I agree that this is an age of specialization and that it's hard enough to keep up in any one field with everything changing so rapidly. Yet, it is sad if we go through life with blinders on and don't keep current on things we encounter in daily life.

Samples:
Cash Cards are making great headway in Europe, and are beginning to appear in this country. Are they right for you? How will you know if you don't keep up with their progress and potential?

Many telephone companies will give you the cheap evening rate at some point in the middle of the day--usually between Noon and 1 PM. The info is right at your fingertips. Do you know where to find it?*

There is a puddle of fluid under your car. It is red in color. Do you know the likely source?**

Where is Channel One on the television set? How could knowing this help you make a entertainment center purchasing decision?***

What does a triangle-shaped sign, turned on it's side, indicate?****

You are driving and come to Highway 75. Does it run generally east-west or north-south? How can you tell?*****

ANSWERS
* The front section of the telephone directory gives rate charts which might surprise you. It also tells you the laws in your state concerning recording conversations, etc.

**If you said "transmission fluid", you're probably right. But some newer cars uses a special coolant in the radiator and cooling system which is red in color.

***The 6-MHz that once was Ch. 1 was given to other radio services, back in the early days of television. The same thing happened with the upper UHF channels a few year ago. The precedent has been set for making major changes to TV service. Probably all analog sets will be obsolete in 15 years. Don't invest TOO much in the old technology.

****This sign, facing your lane of traffic, but on the left side of the road, indicates the end of a passing zone. Get back into the right hand lane quickly. This is a valuable tool for motorists who drive two-lane roads, especially at night.

*****North-South. You know because even numbered highways run east-west. Odd numbers are north-south.

Hope you enjoyed these. I keep remembering an old gentleman who was in a community college accounting course with me, years ago. One day, I spoke with him during a break, and was surprised to learn that he was in the import business and owned seven warehouses. I asked him why he was taking this beginning class in accounting. He replied it was so he would know if his accountant was cheating him! Maybe it DOES pay to know a little about a variety of subjects! By the way, Dr. Bellows, the correct spelling is "useful", not "usefull". Now, let's all get back to Channel 35......

That is exactly why many engineering schools are dropping bullshit
"make-work" requirements like foreign languages, etc. that are not
relevant to the student's major ... there is so much to learn in
one's chosen field of endeavor these days (particularly in the
technical arenas, where so much dramatic change is taking place)
that it is unreasonable to burden students with such "breadth"
requirements just to rake in a few more semester hour's worth of
tuition.

Really? I find it hard to believe that you wouldn't have been able to afford $5-10 for a garage-sale CB and convert it to 10 meters. This would have been a much more useful skill for you to have learned, as opposed to Morse code.

Not exactly Dick ... if that were true, you'd be exceptionally trainable,
and that's clearly not the case ... there's a difference between
"conditioning"
and "training" ... Morse requires conditioning, training requires intelligence.

Mike has no problem with bending, stretching, or even breaking the truth
when it suits his purpose ... I am sure he will take exception with your
suggestion that "(his) right to define phrases is somewhat limited to the
normal meaning of the words involved," since that would tend to force him
to constrain his comments to accurate (even truthful) descriptions of
people, events, and (alleged) "motives."

That is to much to expect of Mike, based on experience with him here in the
newsgroups ...

TELECTRO STEREO TUBE POWERED REEL TO REEL

Apparently has dual separate internal amps. Each amp has
an "On"

Plays and rewinds however it has one problem. The right
amplifier does not work. I don't wish to waste the time to
take it apart and check the tubes.

The interior is fair to good. The case is okay, but has
pitting/mild rust on the chrome part from sitting in a humid
musty cellar at some point during its life. The stereo spkr
grilles on either side of the unit are fine. They might be
aluminum or some other non-ferrous metal.

If you want a quality inexpensive reel to reel tube portable
if you are a bit handy--this is it.

Have photos to email if you're interested. $35 "AS IS" plus Shipping.

I'm not yet a "vet" of this NG. Only been "readin' the acid" for about a month now. But I AM impressed!
I see two forces here... obviously code vs. no-code. The proponents of each group range from those who proffer an opinion and listen for value in the response --- to those who would simply prefer to shoot all who disagree. At times it is almost comical.... the human version of the two rams locked in head-butting combat.
You men can't tell me that you believe you can change another's opinion through your arguments, logic or words. Hell, I not even sure you *want* to change anyone. For if you did, whom would you rail against? So, even though you defend your position with the greatest show of passion, the motives of some of you are greatly suspect.
I have seen no NG written evidence (postings) of a conspiracy to eliminate or ban code. The no-code efforts I have observed have been aimed at a no-code test. If that is what you believe, then go for it. But I for one find little kinship with anyone (on *either* side of the code fence) who feels it is their duty to belittle, flame, heckle, curse, defame, etc..... all in the name of defending their position. One of the great ironies of history is that the Christians killed millions of people during the Cruades..... all in the name of God. Perhaps this is just as worthy a cause.
There have been MANY good ideas posted to this newsgroup. I have seen sincere requests for help go virtually unanswered. But let one of the Big 12 posters hiccup and the thread spans a full two pages.
I came to this NG looking for ideas and views.... not necessarily confirmation of my own opinions. And I found both: those I agree with and those I don't. But I also found the NG to be a haven for discord, intolerance and hate. Hey... its pretty obvious that *nothing* will ever change VSE's mind... or CBRambo's.... or MD's.... or RCA's.... or those of many others for that matter! And there is actually nothing wrong with that -- that is their right. But each of the combatants on this NG must feel that the salvation/conversion of 'the other side' is their personal mission in life. As for me... I'm kinda ashamed of how you guys act sometimes. I just hope the younger hams don't tune into this NG and think this is the way you're supposed to act when you get licensed or when you grow up. Maybe someone can delineate the difference between "road rage" and "NG rage".
Having been licensed for thirty years I have found that my interest in ham radio has declined steadily over the years.... just as the level of respect, willingness to help and camaraderie have declined. Unfortunately, it looks like this is the electronic trend, also.

There is absolutely nothing wrong with learning code and passing a
code test at 5 wpm. Most of my initial contacts were with novices at
5 wpm. We all need a starting point. Who knows what your code speed
will be in 6 months/one year. It is more inportant that you have a
good relationship with cw than what speed you start out with.

The basis for legeal would roughly the fact that 1) part 97
deos not say one of the purposes of ARS is to preserve Code. 2) since
skill at learning code is different for different people, an ADA
augement can be advanced against any code speed highly than the base
code level (5wpm) since that is allegeitly there for treaty
requirement. The acceptance of 5 WPM as meeting the traety rules
wouyld it make very hard to rasie that limit. These Facts added to
the fact these are Public Airwaves would give such an action a fiar to
good chance of suceeding against the higher code speeds

So who are the owners of the no-tune Alpha amplifiers, broken down by
license class?

Cutie Boy, before you go spouting off about language and CW I'd like to know just how many CW contacts you have made yourself? You seem to want to share a lot of information about CW, I'm wondering if you have any credentials? I've had lots of good RC's, do you know what that means Masa? Probably not. I'd bother to explain to you just how we pulled off some really nice QSO's on CW with two different languages being spoken but I'm sure you wouldn't have a clue what I was talking about.

> Some additional comments about CW:
>
> - Too slow (1/1000000 of internet or digital signal ?????)

Speed was never an issue, RTTY was much faster than CW and that was 50 years or more ago. Yet they continued using CW long after RTTY was developed, why?

> - Obselete, Outdated

Old, not obsolete.

> - CQ CQ CQ only. No real life conversation

Again, how many CW contacts have you made Masa?

> - Not many people in the world know it.

Wrong again dickbrain, tune in CQ WW CW and LISTEN instead of professing what you don't know about CW.

Tim, ka8ddz

Quote of the century:
"... there was no radio license 200 years ago... so is
it possible to transmit anything today ?? no... same concept." - Cutie Boy, 98

2798. FS: Wilcox-Gay Recordio #3F.10 Reel to Reel tube portable

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-30 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu

Source record: 180038

WILCOX-GAY RECORDIO (Recordio not a spelling mistake) MODEL 3F.10
Reel to Reel Mono TUBE PORTABLE. Full-sized very old (early
1950's??) portable that handles 7 inch reels. Has the 1950's
styling.

Made by Wilcox-Gay of Charlotte, Mich./Brooklyn, New York.

The unit is in fair condition and would be better if given some
TLC. The leather handle is missing, but metal cabinet mounts are
still there. The plug-in power cord is missing, so I am totally
unable to test it. The unit is sold "as is." $25 or b/o plus
shipping. Pack it free.

I am well aware of Japanese inventive prowess, and more pertinently
to this topic, I am well aware of Japanese technical manufacturing
prowess. What does that have to do with the poor technical infrastructure
of the economic components of the former Soviet Union?

>Wake up to the obvious facts. Obvious to the rest of the world if
>not to you.

What "obvious facts" are those? Are they that the Soviet Union
self-destructed because its economy couldn't bear up under the
demands of a technological world?

>Have a good look under the bed. Any Reds?

More mindless drivel.

>Who was the first man in space?

Yuri Gargarin of course. Now what does that have to do with the
poor technical infrastructure of the former Soviet Union? Did the
average Soviet soldier have access to the technology used in the
Soviet space program? No he did not. It was basically handcrafted
specifically for the space race.

It was not widely deployed enough to equip even front line Soviet troops
with modern communications, much less the reserve formations. Thus
it is unsurprising that they still use primitve methods. Their technical
infrastructure isn't up to mass producing the better technologies. And
that's because they've operated with what amounts to a third world
economy.

>- and all the tens of thousands of other instances.

Indeed, Reg. Just what is the Russian wafer fab capacity?
How many VLSI chips do they produce per annum? And
at what cost each? And why is there a big Hewlett Packard

banner prominently displayed in Russian mission control?

As Bill Clinton proclaimed in the last election, "It is the economy, stupid!" We have a robust advanced technical infrastructure because we have a robust economy to drive it. The ex-Soviets don't because their economy has operated at third world levels.

During the Apollo-Soyuz rendezvous mission, the cosmonauts were astonished to see the handheld scientific calculator our astronauts carried as backup for the navigation computer. They had nothing like it. But they were much more astonished when they were told that anyone could walk into a store in America and buy one off the shelf. That was unbelieveable to someone familiar with the Soviet economy.

It isn't a matter that the Soviets couldn't design such a device, it is that they didn't have the productive capacity to mass produce it so that it could be widely deployed. And that's necessary to equip an army, or a population, with advanced technology.

What is it about that you can't comprehend?

Gary

Gary as all your posts reveal, you're definitely pro digital
communications.
As a ham that has never used anything but
an old homebrew ST-5 and model 15 on RTTY in the 70s, I have
a couple of questions:

Please discuss digital modes from a "pileup" standpoint, not from a
single point-to-point contact in deep space wheareas SNR is the only
critera.

From a practical point of view, If I'm in a "real" 20m DX pileup with
the big guns (all using a 21st century digital mode) will the digital
modes be any better to work the DX station; ie, will they "capture" like
FM? Does the DX station have to be exactly on freq to lock in? How does
all the digital stuff keep from colliding in the pileup and going
bananas?
Is digital only good for one-on-one contacts without 200 stations trying
to make contact?

Thanks, Dick -K5QY

>ANSWER: $$$$$$$$$$$$$$$

Indeed, that's exactly right. The economic consequences of poor
communications can be very high. And the military and life safety
consequences of poor communications can be very grave as well.
That's why OOK Morse is being phased out around the world. It
doesn't have the capacity, availability, or reliability to keep up with
the information demands of a modern battlefield or modern commerce
or modern traffic flows and volumes.

As a side note poor Yuri is now buried in the Kremlin wall after succuming to the wonderful Russian medical system. He died while

undergoing a hemroid operation. First in space only to be killed by a third world infrastructure.

CDXC
(Chiltern DX Club)
The UK DX Foundation
Spratly Islands 1998
12-24 February 1998

This will probably be the last Press Release before our operation. Everything is still on schedule, and much of our equipment has already reached the island to await our arrival. We look forward to working everyone from 9M0C. We want to extend particular thanks to intrepid adventurers 9M6MN, 9M6HJ, 9M6II and 9M6SU who recently endured high seas and bad storms to make the sea journey to Layang-Layang with our heavy equipment. While on the island they achieved what we believe to be a "first", by setting up some 2m equipment and working through the 9M6RGK repeater on Sabah to make QSOs with 9M6JY & 9M6BZ. As far as we know, this is probably the first time that VHF QSOs have taken place between Spratly and another DXCC country. Note that for the propagation predictions to be readable, you need to view this document in a non-proportional font. Please let me know if you need copies of either of the previous two press releases.

Operators Unfortunately Aki VK2BEX has had to withdraw from the operation, but we are pleased to say that his place has been taken by not one but three new operators:

John Krzymuski N2QW (ex-AB2EC). John is an experienced contest and DX operator who until his recent transfer to New York was active as G4DQW. John is a British citizen and has participated in numerous team efforts both domestically and overseas. John works in the USA as a Product Manager in a division of a global telecommunications co-operative.

Jeff Morris 9H1EL. Jeff is a holder of several European CQWW/WPX contest records on SSB and CW, and is also active in RTTY contests. He won BARTG RTTY spring contest last year, for example. Jeff is a retired Electronics/Systems Engineer working in the oil industry on positioning of Drillships by computer.

Kazuo Ogasawara JA1RJU. Kazuo is a Japanese national and an experienced operator who was most recently involved in the last BS7H DXpedition.

This takes our final team to 13, as follows:

Leader - Neville G3NUG
Deputy leaders - Don G3OZF & John G3WGV
Others - Ray G3NOM/9M2OM, Mike G3SED, Don G3XTT, Steve G4JVG, Tony G0OPB,

Kazuo JA1RJU, Vince K5VT, John N2QW, Jeff 9H1EL, Donald 9M6SU.

Shipping/Logistics The nine cases shipped from the UK were successfully landed on Pulau Layang-Layang by a fishing trawler on 21 January (see above). All the Yaesu equipment is now in Kota Kinabalu - we will take this with us on our flights to the island on 8 and 10 February. A final air-shipment comprising mainly the hand-helds and TNCs for the newly developed DXpedition cluster leaves the UK during w/c 26 January. The Battle Creek will arrive in KK in the next day or so. Everything has gone to plan so far..... John G3WGV has also compiled an extensive Operating Manual which will be the basis for our activities on the island. It covers everything from shipping lists and antenna layouts, to pile-up handling. In compiling it, we have taken a lot of good material from the VK0IR operating handbook, as that expedition did a lot to set standards for others to follow.

Pilot Stations
As we said in the last set of information, three pilot stations have been appointed. These are:

Europe: Martin G3ZAY (spratly@dial.pipex.com)
North America: Don N1DG (n1dg@aurumtel.com)
Japan: Yoichi JP1NWZ (jp1nwz@cqpub.co.jp)

Their role will be to channel communications to and from the team on the island (which will be equipped with a satellite telephone, as there have been some problems recently with incoming telephone calls to the Layang-Layang resort). Typically, they will receive comments about band openings, the suitability of the announced frequencies, brickbats and bouquets from the amateur community at large, and will summarise the key messages to forward to the island. This is to avoid information overload on the expeditioners, and yet ensure that we have a good idea of what we are doing right and what we are doing wrong. We will also be able to pass information out to the pilots and Martin, G3ZAY, as Chief Pilot, will have the job of keeping our Web site (http://members.aol.com/spratly98) updated. Hopefully, this will also include photographs (we are taking a digital camera).

Log checking via the Web
We plan to upload logs to the Web on a daily basis. This will not include full QSO information, but will allow you to check that your QSOs were OK. The service will be organised for us by Don N1DG (ex-WB2DND) who did the same for the Heard Island expedition, and by Richard, G4ZFE who has also run servers for DXpeditions. To check the logs, you need to go to the DXpedition home page at http://members.aol.com/spratly98 and select one of the two "am I in the log" servers. Generally you should select the one that is nearest to you. There are servers in the UK and in USA. Once at the server screen, simply type in your callsign and a list of QSOs will appear.

News on Sponsors
We are delighted that there are several new sponsors since our last press

release. The list as of 28th January is as follows:

Corporate Amateur:
AEA Timewave
CQ Ham Radio Magazine (Japan)
Cushcraft
Dunestar
Gladiator Verticals
Martin Lynch and Son (UK)
Nevada Communications (UK)
Radio Active Publications (UK)
The 5(9)Report
Yaesu

Corporate Non-Amateur:
Camel
Malaysian Tourism Promotion Board
Layang-Layang Resort Ltd.
Sabah Tourism Promotion Corporation

DX Associations, Clubs & Foundations:
Arkansas DX Association
Battle Creek DX Group
CDXC of UK
Central Arizona DX Association
Clipperton DX Club (France)
Dateline DX Association
EuDXF (Germany)
German DX Foundation
GM DX Group
INDEXA

And, of course, the Layang-Layang team members themselves who are all making significant contributions to the overall cost of the operation.

We also want to thank the following off-site team members for undertaking a range of duties, missing out on the glory but taking on the chores! BRS32525 Bob - SWL QSL Manager G3SWH Phil - QSL Manager G3ZAY Martin - Chief Pilot, EU Pilot and Web Master G4PDQ John - EU PacketCluster Server G4ZFE Richard - EU QSO Server JP1NWZ Yoichi - JA Pilot N1DG Don - NA Pilot and NA QSO Server

Given the higher-than-anticipated shipping costs, we are continuing to seek funding. Contributions may be sent to G3WGV (g3wgv@aol.com), JP1NWZ (jp1nwz@cqpub.co.jp) or K5VT (vince@getnet.com). G3WGV's mailing address is Canberra Lodge, Heath Ride, Finchampstead, RG11 3QJ, England.

QSLing policy
Much of the design work for the QSL card is complete, and we hope to get cards out soon after the operation is over. All QSL requests go to G3SWH. As we have said before, the expedition will respond 100% to QSLs received, both direct and via bureau. E-mail QSL requests may also be sent to phil@g3swh.demon.co.uk (give full QSO details please). Phil's mailing address is Phil Whitchurch, 21 Dickensons Grove, Congresbury, Bristol, BS49 5HQ, United Kingdom.

The Expedition plans to adopt the following policy with regard to direct QSLs, and encourages all direct QSLers to adhere as closely as possible to speed things up:

a) A self addressed envelope (SAE) should be provided. b) Applications from EU and non EU countries should enclose at least one IRC. c) Applications from non European countries should enclose at least $1 or two IRC's. d) Cards for applicants not enclosing an SAE and adequate reply paid postage will be answered by surface mail or via the bureau as appropriate

Awards
Amateurs chasing the RSGB Supreme Commonwealth Award might like to note that this requires at least one contact with every Commonwealth call area. This includes Spratly under the 9M prefix, as this is a separate call area to 9M6.

And the latest Press Release from ARRL, regarding the revised rules for DXCC, included the following:

"The Spratly Islands, due to the nature of conflicting claims, and without recognising or refuting any claim, is recognised as a Special Entity. Operations from this area will be accepted with the necessary permissions issued by the occupying Entity. Operations without such permissions, such as with a self-assigned (e.g. 1S) callsign, will not be recognised for DXCC credit."

This emphasises the importance of obtaining operating permission from the relevant authority, in our case the Malaysian licensing authority.

After it's over.. Once we are home again, I will be sending out some further information to those on my mailing list, and we will be writing articles for the major ham radio publications including the Japanese CQ

Magazine, the German Funk Amateur and, of course, RSGB's RadCom. We are also scheduled to present at the Visalia Convention, the RSGB Convention in October, and no doubt at many other venues too including, we hope, Dayton. Nevada Publications of the UK have also commissioned us to write the book of the expedition. Guess we're going to be busy for some months yet!

See you from Spratly!

W6 0145 1500
G 1700 0730
UA3 1400 0500

The following has been provided by Bill, W4ZV, specifically in respect of
our low band operations:

Short path bearings Sunrise (16 Feb) Sunset LP overlap
(@ 9M0C sunrise)
Magnetic North 8
Halifax VE1 358 1114 2143 58 min
Boston W1 5 1140 2217 24 min
New York W2 8 1148 2232 9 min
Atlanta W4 22 1221 2322 nil
Chicago W9 20 1245 2324
Dallas W5 34 1310 0013
Denver W0 34 1351 0037
Los Angeles W6 40 1437 0137
Seattle W7 32 1514 0133
>From the above, you can see the following general points:

1. Short path propagation to the Northeast USA after 9M0C sunset
will be very difficult due to the path's proximity to Magnetic North,
however there is some darkness overlap with VE1/W1/W2 before 9M0C
sunrise which will permit skewed and/or long path modes at this time.

2. The remainder of NA will only have a path after 9M0C sunset and
before US sunrise (from 1035 until US local sunrise). We expect that
stations in the Western half of NA will experience some very good
openings at their sunrise. Those of us in Eastern NA will have much
less probability of openings but nothing is impossible on 160!

Hi Walt,

While it may be true that much of the intra-continental US traffic is handled via CW at some point, each of those messages is passed a few times; at least once to the CW op, then from CW op to CW op, and then perhaps from CW op to a local net. But your comment ignores a lot of people - the people who originate and deliver each of those messages, most of whom (in metropolitan areas) are probably not CW ops.

Almost all of the local nets are voice or packet, and although each of the messages may have been relayed via CW at one point, it is usually passed to and from those ops via a local voice net or packet.

Out here, and in other areas near the families of military personell, a fair percentage of the traffic is passed through MARS. As we know, MARS uses primarily RTTY (I think CW is kind of a no-no for them.)

Given that each message is handled multiple times, only one of which would usually be via CW, your statement is at best only partially true.

The NTS is a fantastic service. I have met some of the nicest people on those nets. There are an amazing number of hard working and dedicated people on them. I'm always amazed by their tenacity - how they're always there, just like clockwork. You can rely on them. I think working with the traffic nets is some of the best experience you can have as a ham operator. I encourage everyone to get involved with the NTS at some point in their ham career and lend a hand. Those folks really deserve more of our support.

Dick, this somehow suggested to my inner self that you would have
forgone CW testing also if it were not required when you took your tests
for admission to the HF bands. Tell me it isn't so.

My My My Mr Johnson,

Another victim rears his "Politically Coerced" head wailing at the injustices of the world. Please read his post again Sir. He first of all was making a point ref OOK and no more, in which you chose to instill ref to a select group of handicaped which has been helped via electronics. Shame on you. In making such ref, he said it would Suck to have to use that method. I take it you don't agree. Maybe you could ask your handicaped friends, I'm sure they are glad to have a method but would most likley suggest it Sucks to have to use it.

As for tunnel vision, you and those like you define tunnel vision.

Lighten Up,

Ed

it's hard to beat Collins "mechanical-wise", but when operational
performance counts, I vote for Drake, I still have two 2-B's and an
R-4C
Only R.L.Drake seem to understand the importance of AGC, and without
this no product is worth using, but it seems easy to modify Collins
equipment.....

..and the worst transceiver I had is the japanese Trio TS-500, still
AGC was very easy to improve

> *http://www.garynorth.com for a worst-case scenario *
> **

Now even the survivalist whacko fringe is "into" Y2K Doom and Gloom!

Some of the Doom and Gloom set are actually motivated by things that go way beyond Y2K. They're a combination of survivalists, radical Christians (including reconstructionists), and secessionists with an agenda that includes:

--Returning to "God's plan" for government through total destruction of current institutions. (Wonder if the "Plains Parson" thinks abolition of Morse is "God's plan.)

--Secession of States from the United States of America

--Beginning a period of civil war

--Creating panic to further their hopes for destruction and deliverance

One group, The Creator's Rights party says:

"Think about it: the formation of Home Defense Forces perfectly symbolizes the actual meaning of the Y2K problem. Should the Y2K problem go unresolved, you in self-defense could actually be forced to fight off hoards of starving and thirsty people streaming out of dark and cold cities all across this nation."

Damn, Rigley, you run with a *WEIRD* crowd, *much* weirder than those beepers!

Good point, Tim. Glad you brought that up. All the remotely convincing arguments against CW I have seen in this ng were made by CW qualified hams, mostly in the upper license classes. I have yet to see an original argument against CW testing that holds any water at all be made by somebody who is not proficcient at Morse. Kind of ironic. Most of those intelligent enough to be even a little bit convincing saw the logic in learning the code first and getting on the air with it, and arguing for it's demise later. Cutie's arguments are mostly ridiculous one-liners and personal retorts. A poor testimony to our educational system. And I doubt that he has ever made a CW contact. Won't bother me much if he never does.

I guess I can handily sum up with this old dicho that has been seen in this ng before:

"Don't try to teach a pig to sing. It wastes your time and annoys the pig."

"Where's that big 'ol CB RAMBO??"
"I wanna hear him TALK TOUGH!!"

You have made one of your rare good points, Drew. Sadly, the answer is two-fold. Human nature makes us all less than perfect, and most people, especially the type of power-hungry people that are usualy motivated to run for office, have episodes of "ME" thinking. Also, even though I am sure you did not vote for them and I sure didn't, WE THE PEOPLE did. We're just gonna have to take our medicine along with those who as individuals did vote for them.

The thing with Billary will be resolved through due process. Hopefully, whatever resolution we get will be the right one. It might not, though, and we may just have to accept that the system is not perfect.

BTW, maybe this thread should move to another ng. Been going a while and it doesn't seem to have much relevance, and the entertainment value is approaching nil after so long.

2819. Simplex Field Tests 07 Feb 1998

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-30 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6atcjt$qu4@news.Hawaii.Edu>
Source record: 180059

```
------------------
CALL FOR VOLUNTEERS
------------------

Simplex Field Test in CD District V
Saturday, 07 Feb 1998

breakfast meeting - 8am at the Koa House in Kaneohe
field tests to follow directly after breakfast

----------------------

A long-range project of the Oahu Civil Defense Agency (OCDA), the
Radio Amateur Civil Emergency Service (RACES), and the amateur radio
community is to provide a detailed plan for island-wide simplex
communications.

The simplex mode is the fundamental backup system in the event normal means
of communication are disrupted. For example, the commercial phone system
goes out or radio tower-dependent systems are blown down.

We are working to establish usable simplex links within local areas and
critical connectors back to central command/control points. Ideally,
the radio operator at a emergency shelter will be equipped with the master
simplex plan. This will indicate where and how the shelter can contact the
local Emergency Operations Center (EOC), HPD, etc. It will also demonstrate
how to pass a message via simplex from the shelter back to OCDA.

Successful data has already been collected for CD District III (Waianae).
Next Saturday, 07 February 1998, we will be working in CD District V.
This region goes from Pupukea on the North Shore down the Windward Coast
to Kualoa. This beautiful region of our island-home has diverse and
challenging communications needs.

Please consider joining the team this Saturday. It will be fun day of
fellowship and radio work. The end-product will be excellent communications
plan to the serve the community in times of need.

ALL RADIO AMATEURS ARE INVITED. PLEASE PASS THIS MESSAGE ALONG TO INTERESTED
PARTIES.

Breakfast / Planning Meeting
Saturday morning (07 Feb) at 8am at the Koa House in Kaneohe
46-126 Kahuhipa, phone number 235-5772
from town: Likelike, left onto Kamehameha Highway, left onto
Kahuhipa (last major road before Windward Mall)
talk-in frequency : 146.52 MHz (simplex, of course)
```

What to bring:
mobile radios
portable radios
J-pole antenna, etc
road map
pencil & notebook
camera
GPS
plus, anything else I'm forgetting

Please contact myself to sign-up and/or for additional details.

Mahalo and 73s,
KH7CL
RACES Deputy Coordinator

Jeffrey Herman, KH2PZ

Tim Hynde <hynde@flash.net>
shared these priceless pearls of wisdom:

->
->Cutie Boy, before you go spouting off about language and CW I'd like to
know just
->how many CW contacts you have made yourself?

OK, "duckbrain", you want credentials? My logbook started in '59 and has a few thousand CW contacts. That was back in the days when we were required to log each contact. I suspect I've had a few thousand since then unlogged. I don't know if you were born by '59, but with a KA8 call, you sure as hell weren't licensed then.

You seem to want to share a lot of
->information about CW, I'm wondering if you have any credentials? I've
had lots of
->good RC's, do you know what that means Masa? Probably not.

What is a Masa? Why abuse the net with your "in" attempt at belittling people that don't speak your patois? Or do you know the meaning of *that* word?

I'd bother to explain to
->you just how we pulled off some really nice QSO's on CW with two
different
->languages being spoken but I'm sure you wouldn't have a clue what I was
talking
->about.

Si. Gracias, por nada.

->Speed was never an issue, RTTY was much faster than CW and that was 50
years or
->more ago. Yet they continued using CW long after RTTY was developed, why?

Because the goddamned ARRL convinced the FCC that the majority of amateurs "supported" CW. Most of us couldn't care less whether or not CW exists, we sure as hell don't support a separate sub-band for it, and we sure as God made little green apples don't support a mandatory part of the exam for it. You can pound brass until your wrist falls off for all I care, just don't mandate it for the rest of us.

->Old, not obsolete.

No, obsolete was a perfect description. Aviation and radio are pretty close comparisons, in that they started about the first part of this century, went through some major advances in wartime, and have contributed much to the human knowledge base. At one time, part of the examination for a pilot WAS a knowledge of the morse code as well as the ability and knowledge to start an aircraft by hand-propping. As aviation advanced, so did the pilot exam requirements. Unfortunately, radio didn't follow suit (at least not at this point in time).

(Yes, I know how to do both, my students will always know how to do both, but the pilot exam doesn't require either.)

->
->> - CQ CQ CQ only. No real life conversation
->
->Again, how many CW contacts have you made Masa?

See paragraph 1. Learn to use commas properly, Masa.

->> - Not many people in the world know it.
->
->Wrong again dickbrain, tune in CQ WW CW and LISTEN instead of professing what you
->don't know about CW.

YOU listen for a change. Calling people names is the poorly educated's only response to a valid argument. You might have some good points if you could only learn to express them. Like I said, you can use CW forever for all I care, just don't mandate a dead technology for the rest of us. At one time, a year of Latin was required to graduate from high school. How's your knowledge of the Gerundives Of The Second Periphrastic Conjugation coming these days?

Hiya Masa;
I have stood by,and watched you make a fool of yourself right across
Canada,,,from Vancouver,all the way to Quebec.
Now ,I am not a one to complain,especially when a person sets themself
up as an authority as you have,but being a Canadian;I do object to
you making us a whole look bad.
I want to personally apologize here for Masa's behaviour,as a fellow
Canadian,I am apalled by his lack of judgement,,,and his constant
verbalizations,,,without ever once putting his brain into gear first.

BAD point!!
1.) Those who ignore history (or never read any) are doomed
to repeat it.
2.) To write, you must be able to read (and therefore have
been exposed to some literature).

3.) a minimal level of physical conditioning is necessary
for even moderately good health.

What else did you miss out on? Logic???

Nope wasn't born until 62, my log didn't start until 79 and is mostly CW. I have not counted but I've got a dozen or so log books filled some with contests some without. My question to him was very straight forward. I am asking how someone can possibly comment on what kind of conversations / usefulness / etc. exist using CW if you have never had any conversations using CW. Your operating credentials, Jim, and the year you were licensed have nothing to do with Cutieboys comments on CW.

No one has good definition of exactly what a Masa, a.k.a Cutieboy *is* As far as belittling anyone, I'm simply asking him how he can make claims about using morse on the air (e.g. CQ CQ only no real life conversations) without ever having had a conversation using morse. No I didn't know what patois was, but I looked it up, thanks for the new word.

Cutieboy said:

Some additional comments about CW:
>
> - Too slow (1/1000000 of internet or digital signal ?????)

And I responded by indicating that speed was not the issue since CW had continued side by side with RTTY (faster) for over 50 years so there must have been another reason OTHER than speed that kept it alive. RTTY and CW have been used commercially all over the world. Sorry, but I have NO IDEA what the ARRL, FCC, God making little green apples, mandatory parts of the exam, and sub-bands have to do with the subject of morse code being slower than a digital signal.

> ->Old, not obsolete.
>
> No, obsolete was a perfect description.

Unless in your patois obsolete is defined differently then it would not be a perfect description since it's defined as "no longer in use" which it clearly is. Thanks for your comments regarding my grammar, now go look up obsolete so you'll know how to use it the next time.

John looks like your getting some good replys here, the one liner about 5 wpm not being code is not literal, I believe the point was the 5 wpm is very slow and easy enough for anyone to learn. FWIW I learned the old fashoned way E I S H 5, T M O 0, translated . .. ., - -- --- -----, it worked well for me and I raised the code speed to a little under 20 wpm within a year or so of casual operating. I have heard good things about the Farnsworth meathod but I have also heard that it is MORE difficult to then copy someone sending at 5 wpm or less. Personally I think learning slow and building your speed on the air is the best way, there is much more to the 'copy' besides speed. Learning how to copy through noise and other conditions comes only through experience, but either way I don't think there is much chance of messing up.

Best of luck to you,

Tim, ka8ddz

I think CW is fun. I started as a novice in 1984 and logged over 100 CW contacts. Most of my unique contacts are CW.

The reason the majority of hams don't use CW (and I'm not convinced of your metric) is because the no code test flooded the bands with no-code operators.

Wonder what the population of hams will be if CW is eliminated as a test requirement.

Look at it this way. A certain percentage of hams are corrupt. Assume that an equal number of coded and code-challenged hams are corrupt. It would seem to me that taking advantage of laziness would reduce the amount of corruption on the bands by keeping the code requirement.

I quite enjoy what little space is left on HF - simply because the majority of wannabe hams lack the initiative to complete the code requirement. It didn't kill me to take the tests and I'm enjoying the rewards of my efforts.

Oh Paleezzze. The ARRL is a non-profit organization. They don't survive by selling code tapes. It would make more business since for the ARRL to sell their wares to the flood of freeloaders that would become hams if tickets were given away. The ARRL simply protects the interests of hams like me who believe the code requirement serves a useful purpose.

Jim is right about the subject getting a little hot, but I am a little
interested in your statement Tim, Re: No-coders can't go to 3950.
Are you labouring under the mistaken assumption that all those here on
the side of No Code Testing are not qualified to tune up and tx on
3950? That would be a mistake as many have long since done the deed and
are leagal on HF. They just don't agree that Morse testing serves a
purpose, reasonable purpose I should say. Some even like OOK and use it
all the time. Still don't see the need to test for it. Not a big deal
but needs to be clarified for some now and again.

Regards,

Ed

Anyone serious about amateur radio in Canada would do well to visit the
Radio Amateurs of Canada website first, at
http://www.rac.ca

Not only does it have information, but it also has links (including to the
"McGill Amateur Radio Club Study Guide" at Cutie Boy's site) to well
established pages Canadian ham pages that carry items of interest to both
beginners and old timers.

It also has lists of local ham clubs across Canada, distributors that
carry RAC study guides, and a list of upcoming hamfests in Canada.

The site is comprehensive enough that people really ought to go to it for
their first search for information here in Canada. If a site is not
linked, I'm sure they would be glad to add a link. It's a whole lot
easier to go to one page and branch out from there than stumble across
somebody's webpage that may or may not be the best source. I have seen
other good Canadian websites for amateur radio, but there is no sense in
listing them since they do have links at the RAC site.

The RAC has also recently integrated the RAQI website into the overall
site, for those looking for French material.

As for the study guide in the subject header, I don't know whether it's
useful or not. A little problem of using a Mac Plus (wasn't someone
comparing a 286 to CW?) that I doubt could run the software to view a PDF
file.

copy.
> I was congragulated, not hazed.

The point is that requiring anyone to take *any* Morse test is a form
of "hazing ritual" since there is no real justification for requiring
Morse at all in today's world.

> What good does it do to have a throughput of a kilobaud if I can only type
> about 35 WPM? Computer-assisted digital modes are indeed superior for
handling
> messages, but the extra throughput is waaaay overkill for casual ragchewing.
> Bandwidth is the benchmark for that

READ MY LIPS ... it doesn't matter how fast (or slow) you can type ...
the ability to transmit data in rapid bursts leaves the channel free for
others to use during the "dead times" ... thus, the "I can't type that
fast" argument is lame.

And the ONLY valid measure of spectral efficiency is bits/sec/Hz, not
raw bandwidth ...

> > But, it is the cheapest,
>
> Sorry, but I'll pop the extra

You apparently do ... so does everyone else here on the net ...
or have you figured out how to key today's modem standards by
hand and copy them by ear???

> Get over the hang=up of "copying by ear" ... it's most
> >inefficient.
>
> Doesn't seem inefficient to me. I hear and I understand, as long as the

surpass
> it.

I will refer you to Deja News for one of Gary Coffman's EXCELLENT posts on
this ... or you might find one of mine, too ... we have both proposed credible
systems that could handle tens of thousands of simultaneous, non-interfering
20 wpm CW equivalent QSOs in the space of just the 20m CW/digital subband.
Gary also has posted excellent explanations of how (at equivalent data rates)
even simple FSK/MSK would consume less bandwidth than OOK Morse and provide
significantly better weak signal performance ...
(This is true, despite the Morse Myths that you've been brainwashed with all
these years ...)

> > and it encourages
> >
> >homebrewing requiring only simple designs.

>
> As a matter of fact, on the simplest of CW QRP transmitters, you will be
nearly
> doubling the parts count, and requiring interfacing to a computer.

Not necessarily ... at the same data rates that are used for OOK Morse, one could easily hand key and copy by ear FSK ... the old spark rigs actually pulled the frequency rather than "making and breaking the arc" ... using a better (uniform) code than Morse would also make decoding easier either for man or machine ... though machines can clearly do much better than humans can, particularly in marginal conditions (IF good codes are used, that is, but Morse is NOT a "good" code because of its non-uniform nature.) There is also reportedly (though I have not personally seen it, since I am not interested in "by ear" decoding methods) a body of evidence that humans can more easily detect tonal shifts (FSK) in a noisy environment than the OOK amplitude keying of OOK Morse ...
Again, you have obviously been mislead by the constant stream of Morse Myth dogma that flies in the face of engineering facts.

> Believe me, there are no ccomputers in dumpsters down here in the valley.

Check the dumpsters in a better neighborhood???

Morse code was invented in the 1840s ...

> I am not prejudiced against ANY mode. I have a computer, and I have worked
> several digital and a couple of image modes. I enjoy it, too, but I really
> like CW.

Great ... more power to you (seriously, not being sarcastic ...) I have NO problem with anyone who WANTS to use Morse using it now or forever (despite MD's lies and allegations to the contrary) ... Just please don't insist on forcing it on everyone else solely because YOU like it ...

> You, on the other hand, seem to have a manic hatred for CW. instead
> of looking for common ground, you zero in on CW as a divisive issue.

I don't hate Morse as a mode and don't wish to preclude anyone from using it if they voluntarily choose to ... I hate forced Morse testing as an artificial an unjustified barrier to entry to HF for otherwise totally qualified people ... I've worked with hundreds over my 25+ year career as an RF engineer ... Morse testing IS a divisive issue ... I didn't make it that way, it just IS that way. It's been that way for the nearly 25 years that I've been a licensed ham ... It will continue to be that way until it goes away or the ARS is killed by the FCC/Congress for acute stagnation and refusal to accept new ways and modernize ...

> By the way, the varactor for FSK is a pretty neat way to go, I'll give you

> would probably go good in QST.

The varactor can be used to pull your rock for FSK ... and as I said before you can key it by hand and copy the tone shift by ear at OOK Morse-like rates.

You could even learn to copy Baudot and/or ASCII by ear at those rates, though as I've said, machines can do it much better ...

That's not what he said, Mark ... he said nothing about "TTY" ... he likened
Morse to "using the touch-tone keypad to talk letter by letter in code."
TTY is MUCH closer to modern communications methods than Morse ...

What a crock or crap, Jeff ... contesting trains for aggressiveness and
competitiveness with a "stomp 'em into the dust by brute force" mentality.

That is NOT effective training for providing emergency communications,
where discipline and the ability to "back off," listen, and behave,
rather than trying to dominate can be far more valuable than any of the
contester's "skills."

If CW makes good hams (who goes through cleaning process), we shouldn't see swearings and LSB music stations on 80m band + with call signs.

It is like saying that who has higher education does not commit crimes... (which is absolutely false statement)

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur

Unfortunately, CW emergency communcation is rarely used (if
you know one, please give us the example).
Many of amateur emergency communications are handled locally such as
the use of 2m repeater OR else VOICE HF.
(Moreover,) in commercial industry, 99% of ships now do not use CW as
a method of communicating SOS.

Some [Pro-CWers] say HF amateur bands will become CB band if
there is no CW requirement for HF bands.
10 years ago before no-code license was created, many said the same
thing. "VHF bands would be flooded and would become worse than CB
radio" It didn't happen. Umm... do the amateurs who do not go
through the CW elimination will be same as CBers...
Listen to 2m and 440. It's much clean compared to some HF bands
where you can listen to those CW foggies who breaks the law and makes
the bad representation of ham community.

CW:

Also some say you can communicate who doesn't know English (or simply
between different languages) very well. This is a false statement.
You may be able to make "QSL" (just exchanging the call signs and
that's it) but whatelse you can do if she doesn't know "any" English
and you have no idea about her language ?? CW will not eliminate
language barrier. If you have no idea what " J'ai 18 ans. " (if
someone transmits in CW) means, you are deadend !!

Some additional comments about CW:

- Too slow (1/1000000 of internet or digital signal ?????)
- Obselete, Outdated
- CQ CQ CQ only. No real life conversation
- Not many people in the world know it.

2858. Myth #6: Keeping CW will save ham radio

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-30 00:00:00 UTC
From: cute@radiotelephone.net.ham
Message-ID: <34d14a93.1981937@news.total.net>
Source record: 180150
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur

Keeping CW will not save ham radio.

Reasons:

- Does not attract many people because they cannot spare time
- Less amateurs
- Corruption of amateur radio

- Many people prefer anything faster if it is available (CW is too slow. Like many prefer Pentium instead of 286)
- No point of learning CW (no point of using 286) because other fast means of communication are available
- Less amateurs
- Corruption of amateur radio

- HF radio (CW) in general is expensive compared to other faster methods of communication (like spending $10000 on 286 when you can buy $1000 Pentium. No make sense to pay thousand dollars + (such as repair) on CW rig when you can get computer + internet for hundreds)
- Less amateurs
- Corruption of amateur radio

- Obselete (think of cars, mobiles. I wouldn't want to drive cars and mobiles of 100 years ago in winter time. Think of abacus. It's obselete and it's stupid to force it to people.)
- Not many people care (or just simply ignore amateur communication)
- Less amateurs
- Corruption of amateur radio

Source record: 180152
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur

ARRL supports CW. Why ? Think of it.

Someone suggested previously:

If CW requirement goes away...

- they cannot sell code practising tapes or devices
- less funding...

- they cannot sell CW accesories (keyer etc.)
- less funding...

What are they going to do if it goes away ?? They somehow
need to collect the money (the membership fee only does not cover the
cost to operate the organization). They can't sell call books
because we can search the call sign on the internet now...

Yes, one must put an effort for CW, but one must put an effort for written as well.

I took three days to remember a half of question set (500 questions).

I took one day to pass CW. CW is just made up of dits and dahs. Remember 26 characters and 10 numbers. What a crap ? No wonder why CW doesn't make good hams on HF.

I wonder if there is a link to "ham actor" or "stage ham". In the early days of radio, some early experiments involving AM fone involved transmitting audio from those new-fangled fonographs and other forms of audio entertainment. There might have been some sort of comparison made with vaudeville performers. Radio has always been used as a stage of sorts by some. Even though we can no longer play music over the amateur bands (with one exception that I know of) there are a lot of OMs who seem to relish in being the center of attention at the mike. Just a stab in the dark, but a parallel could be drawn here. Anyway, sounds more plausible than some explanations I have heard or read.

73,
John

5 WPM IS INDEED code. Traditionally, that is the speed hams start out at. Slow copy is nothing to be ashamed about. But, there is certainly no reason not to learn at a higher speed... in fact, there are very good reasons why you should learn at even as high as 20 WPM and bypass 5 WPM altogether.

When you learn straight 5 WPM code with regular timing, you can't help but to count dits and dahs at such a slow speed. This seems the path of least resistance, and you will learn by this method without even thinking about it. The problem is, when you double your speed, your wetware can't process the elements fast enough to go any faster. Thus, the infamous 10 WPM hump. It is very hard for most people to overcome and upgrade to 13 WPM when they have learned by the counting method.

With a faster speed, say 16 to 20 WPM, there is no time to count. You will be cueing on the sound of the character, not the series of dit and dah elements that make up the character. To facilitate learning, the spaces between characters can be lengthened so the actual throughput is at a much slower speed. This fast-character, slow-space timing is called Farnsworth code. It is a proven learning technique, and makes upgrading much less painful. The ARRL code practice tapes as well as the actual code test for 5 and 13 WPM are Farnsworth, with the characters sent at 18 WPM. 20 WPM test and tapes are straight morse. I suggest learning with Farnsworth at 20 WPM characters right from the start. There is no reason why you can't be able to pass the Extra class code exam in a couple of months, and be conversational at that speed in 6 months or less if you are really motivated.

Most programs allow setting the character speed and word speed separately. If yours does not, find a program that does. My personal favorite is Supermorse

by WD5CID, but there are others that are pretty good too.

Listen to fast code on the air, too. You might only get the odd letter here or there, but that's OK. Never practice at a speed you are comfortable with. If you can copy 80% or more, it is definitely time to crank it up a hair.

When I was learning, I had a micro-casette recorder, the cigarette pack sized units that use the little bitty casettes the old tape driven answering machines used. I would run Supermorse, usually playing continuous random groups, at various word speeds and 20 WPM character speed. I taped the output, and I then had portable code practice. Random groups are not that much fun to copy, so I would treat myself to a text file every once in a while, usually toward the end of a tape. I could carry it around anywhere, and listen, finger-writing on a smooth surface when nobody was around staring. If you are "caught", and don't feel like explaining, just stare back. They will leave.

5 minutes here and there several times a day is much better than cramming for an hour or two every evening. It is easy to get burnt out. Speaking of which, if you seem to run up into a wall and progress seems to stop, give it a rest for a day or two, then come back to it.

Listen to really, really fast code every once in a while, even if only for a minute. That will make 20 sound slower and build confidence. Good OTA practice is the W1AW fast code practice, and WLOs automated CW broadcasts which sometimes are 30 minutes long at 31 WPM. tune around in the maritime bands at the top of the hour. You'll know when you have found them even if you don't get the callsign when you hear that computer-generated 31 WPM code. It sounds quite a bit slower than it is.

I used to let Supermorse run where I could hear it from my rack and go to sleep listening, usually at a slightly faster speed than my study speed. When I woke up, I would turn it down and practice for about 5 minutes. Turning it down from a faster speed makes it sound a lot slower than it is. There might have been a subliminal learning effect at work too, for all I know. Sounds good anyway.

When you go test, usually the 20 WPM test tape will be played first, folloewd by the 13, and then the 5 WPM. You may as well take the 20 even if you aren't confident of passing. You never know! Also, it will make the 13 sound slow, and the 5 WPM sound like slow-mo special effects.

Supermorse can give you a randomly generated sample Morse Code test, complete with questions. It uses dictionary files and templates to create the 5 minute format test that is remarkably similar to the one you will actually take if you are tested by an ARRL VE team. A couple of days before the test date, take a few of these practice tests, and pay special attention to names of antennas, rigs, states and cities, WX conditions, etc. If you hear "ANT HERE IS CUSH..." go ahead and get it down, abbreviating Cushcraft, clear your mind for a sec, and get ready for an alpha-numeric model name. Same with "RIG HR KENW...", etc. The practice exams teach you very little about copying code, but they do teach you how to pass the exam.

Before you get very far in preparing for the actual test, contact the VE team and find out exactly how you will be tested. You can do without surprises.

Read past posts on related subjects and you will find lots more hints on learning the code. And yes, if you feel the least bit motivated, learn at 18 or 20 right off the bat, and stick with it for at least a week before giving up and dropping down to 5 WPM. You will be glad you did.

Good luck

: Yep! And guess what? CW is digital. It is a simple reliable digital
: protocol. It can get through when other digital protocols can't.

I would disagree. The modern digital techniques will work where the
signal is "in the noise" - or even below the noise "floor".

It could probably be done with CW, but it isn't worth the bother. CW is
too slow.

: > and even Morse can be better sent by machine
: > than by people, thus even the uses for morse dont seem to justify
: > learning it by hand.
:
: Not really, current use of rtty, packet, and gtor takes a much better signal
: to noise ratio get through than CW does. In packet modes with error
: correction the throughput can be almost zero because of repeat packets. A
: good cw operator can often copy through the noise and fill in lost
: characters. The human brain is still the best filter of noise and
: interference in weak signal conditions.

See above.

And, yes - I am in favor of retaining some sort of CW testing, even if it
is only at 5 wpm.

-

I have several questions relating to this. The Constitution says that a president can be impeached for "high crimes and misdemeanors." I have listened for the last week as television talk show guests (often lawyers) argued over the meaning of "high crimes and misdemeanors."

They appeared to have great difficulty coming up with a definition. Yet it seems rather obvious to me. A high crime would be something like murder (what we call a felony today). A misdemeanor would be a low, or minor, crime like shoplifting.

So, at least as I read it, what that is saying is that the president can be impeached for ANY crime (felony or misdemeanor). Is this correct? And why would there be so much confusion by the television talk show lawyers?

Taking this a step further, if the president had an affair with Gennifer Flowers (which he admitted to, under oath), and an affair is illegal in Arkansas and Washington, why can't he be impeached? And why isn't he?

In a related argument, a military general was forced to resign after his involvement in an affair ten years ago became known. Clinton supported his resignation, and his resignation, following the Kelly Flinn incident, was cheered by many liberals (expecially liberal women).

Why is Clinton not holding himself to the same standards he held for this general? And why are liberals not in support of Clinton's resignation, especially when they were so supportive of this general's resignation?

Note that I am not taking a position here (either liberal or conservative). I am only asking questions about topics relating to this issue.

Gary,

Here is the simple and factual answer. There are a lot of myths about
the origion of the term "ham" as applied to radio hobbiests, but the
real answer is that nobody alive today has the accurate information.
It has been lost in to antiquity.

rather than trying to dominate can be far more valuable than any of
>the
contester's "skills."

This is true to an extent, but not with the low-power divisions. When you only have a hundred watts, you don't do much stomping. The low pwer high scorers do a lot more listening and pounce at the right time, when their sig can be heard. As for the kilowatt+ stations that operate full tilt boogie, I am inclined generally to agree with you to an extent. Even on CW, what I hear sometimes is ridiculous. 50 stations come up at once when a coveted station signs off, all within a 15 Hz slice of the pie.

It is true that not all contesters will do public service, especially on weekends, (HI HI) but the ones that do are equipped to do the job, that's for sure. It would be nice, though, if all contests were called off during ANY major emergency, not just when a communications emergency is declared by the Commission. What you described during the hurricane is shameful, Carl. We gotta pay our dues sometime even at the expense of neglecting our personal favorite aspects of the hobby.

I don't personally have a fondness for contesting, being more of a casual ragchewer. I would like to see a new protocol... somebody who does not QSL, does not contest, and only wants a good ragchew could sign /RC or something like that when calling CQ, and then the answering station would know not to expect a QSL or even a contest log entry. In fact, I think I'm gonna start doing that, and I don't mind taking the time to explain what it means. There's room for a bit of everything on the bands... contesting, award chasing, fone, no-coders, even no-QSLers.

Meanwhile, as long as the contesters dont bug me on 17 and 30, I think I can coexist even if I don't understand them. Go for it, guys.

a
>method of communicating SOS.

Sorry, Masa, It's not that bad yet, even under US flag. I would say something like 70 percent of US flag ships today have given up on CW, including my own. FOC ships almost universally still use CW and will only give it up when they have to. 99%? maybe after 1999. Listen to the WLO traffic list at the top of the hour. Almost all the calls that do not begin with G, K, or W will call shartly thereafter on one of the calling freqs for their traffic depending on time of day/night where the ship is at. AMVER is never sent over INMARSAT because then it is no longer free... it is sent CW or SITOR. WX OBS is mostly CW tfc. most FOCs still use CW for everything.

Note that the change away from CW for routine TFC is not due to the judgement of the R/O,,, it is because the R/Os are being terminated, leaving no RF savvy ops on board. GMDSS allows this if full implementation including shoreside maintainance is in effect onboard.

I can't wait for your well thought out, logical rebuttal. If you want to argue against CW, check out Carl's posts.

Morse at all in today's world.

Nobody is required to undergo this "hazing". You hold up modern technology as
the only way to go... VHF and above are even better venues for use of advanced
methods than HF. Could you imagine a 20 meter/40 meter satellite repeater?
EME? A lot of exciting things are hapenning in the high bands, and there is no
need to use HF if the code is a burden.

others to use during the "dead times" ... thus,
>the "I can't type that
fast" argument is lame.

Again, now we are requiring the use of a computer. If nothing else, for
collision prevention and recovery, error correction, automatic power level
adjustment, etc fur the optimum use you suggest.

> Not all of us have computers... all of us hams, that
>is.

You apparently do ... so does everyone else here on the net ...
or
>have you figured out how to key today's modem standards by
hand and copy them
>by ear???

Yes. I apparently do. Probably half of all hams don't. I would rather require a hand-sendable, ear-decodable mode than require the purchase and use of a computer. It would suck carrying a computer around for communication on, say, a backpacking expedition, even if it were a notebook, when a Wes Hayward style cigarette pack size HF transciever by itself could run off hat-mounted solar cells and weigh less than a half pound. Mobile, portable, etc long haul comms shouldn't need a computer.

for man or machine ... though
>machines can clearly do much better than
humans can, particularly in marginal
>conditions (IF good codes are used,

that is, but Morse is NOT a "good" code
>because of its non-uniform nature.)
There is also reportedly (though I have
>not personally seen it, since I am
not interested in "by ear" decoding
>methods) a body of evidence that humans
can more easily detect tonal shifts
>(FSK) in a noisy environment than the
OOK amplitude keying of OOK Morse
>...

Again, your last statement is pretty much true. I think I read something somewhere about FSK morse. sounds good to me cuz nothing is ambiguous... i.e. a lack of signal could not be mistaken for a space if one of two tones is required to be present at all times. And again, you are back to using more bandwidth than CW. due to having at least two distinct tones.

Again, you have obviously been mislead by the constant stream of Morse
>Myth
dogma that flies in the face of engineering facts.

> Believe me, there
>are no ccomputers in dumpsters down here in the valley.

Check the dumpsters
>in a better neighborhood???

I'll tell you what, Carl. Come on down and find a dumpstered computer anywhere in the valley. I'll buy it from you.

>hand and copy the tone shift by ear at OOK Morse-like rates.

You could even
>learn to copy Baudot and/or ASCII by ear at those rates, though
as I've said,
>machines can do it much better ...

Well, Baudot might be slightly more painful to learn, since every character would be 5 bits. Not so many easy ones. I think morse is still ideal for ear copy even if FSK is used. Nevertheless, I can tell when RYRYRYRY or CQ CQ CQ etc are sent at 45 Baud RTTY. The sounds are indeed ear-discernable even if not easily decodable.

Good arguments, Carl. You reason pretty well and you obviously know your stuff. You still haven't convinced me, though. Nevertheless you have earned my respect.

As a matter of fact you can advise her that she is doing so and notify
her that she is violating a subpart of Part 15 FCC rules for consumer
electronics. (shall not cause interference...)

Harmonics are the fault of the transmitter and if there have been any
modifications made to the unit (even a cheapy consumer item) you can
cause some problems for the service shop that screwed up her cordless.
Please be careful to use diplomacy, these regs have bred some real
"Hatfields & McCoys"

In other words, they wish the issue to be "buried" and neatly tucked away from public view on a much less-trafficked newsgroup. They hope it will go away. Guess what? Ain't going to happen. We're here until the code requirement is removed...either by the FCC, an act of Congress, or by a court decision. My guess is that the latter will be the eventual method by which this irrelevant barrier to obtaining a government license to use public radio frequencies is ultimately removed.

You should have the "wide view and range" you speak about, so that you
would not come to the conclusion that I was only interested in things
related to work. This was the point I was trying to make! If the
teachers wouldn't have wasted your time with History and Literature, but
rather on how to read and comprehend things properly, you would not have
come to the ridiculous conclusion that you did.

First of all, to take the code test, it is ALSO a multiple choice test
where you only have to recognize three letters to find out which A, B,
C, or D message it is..

And second of all, the Technical information is of use to ALL Hams,
whereas Morse Code is only of use to those who wish to use it for
nostalgia.

You people are missing the point. If you don't like the requirements to obtain an Amateur Radio License, change the requirements. That's what people do in a free country. The requirements to vote once were white, male, and property owner. Do you think that shouldn't have been changed?

Sure would--unless you were stuck in a blizzard at a phone booth, the only sign of civilization in view, and some vandal had removed the phone booth's mike cartridge. Then it might be helpful indeed, you could just dial up the ARRL HQ and send your message of desperation in code!

Don't bother to call Carl or Lennie or Charlie, they would be of no help at all.

If, and only if, you have the necessary reference library to go along with
them. Buddies of mine have entire "reference libraries" at work, on thousands
of pieces of fiche (and now luckily CDROM) which allow them to cross-
reference all these components. Engineering companies hire librarians now
to keep track of all the reference material pouring in.

>And for a hundred bucks you can have a complete suite of VHDL tools, including

>Raw NUMBERS, yes. But numbers of licensed amateurs...particularly no-code
>Technicians, have been increasing much faster. Result: the percentage of
>licensed amateurs who are affiliated with the ARRL is now at an all-time low.

With the 10 year license expiration program in place, and higher-class
licenses only starting to expire and roll out of the database this year,
it is pointless to draw any meaningful long-term statistics of this nature.

The codeless tech license saw a brief period of rapid growth, from its
inception in 1991 until the mid 1996 timeframe. After that period, the
number of hams entering that route started to level off, the license
class having already attracted the bulk of people waiting for a codeless
VHF license.

However, because the tech licenses are not scheduled to start expiring
until 2/2001, and will not start rolling out of the FCC database until
2/2003, drawing conclusions about percentages and relative numbers is
really pointless. Not until 2013, after the entire pool of tech operators
has gone through one cycle of expirations, can you really draw any
meaningful conclusions about the numbers, and their impact on other
statistics like the number of ARRL members.

One of the favorite stories about where the term "ham" came from is that publisher
Hugo Gernsback put out a magazine called "Home Amateur Mechanic". I read through
Clinton B. DeSoto's "Two Hundred Meters and Down" and found mention of Gernsback
and a magazine of his which published technical information on how to build radios, but
it was called "Modern Electrics". I'm sure he could have published more than one magazine
on the subject, but does anyone own or has anyone actually seen a copy of
"Home Amateur Mechanic"?

Thanks.

Look Cutie boy, you proposed the offer and I responded. What I expected was a schedule on CW to work my son, instead you toss out more spam. You might do well to have a few QSO's with the 'old fog' my experience has been that most people with 30 or 40 years on me have one or two things to share. You on the otherhand seem to know an alot about making CW contacts even thought to date you haven't told us if you yourself have ever made one.

Well Cutie boy, are you now saying that you don't like voice modes, I had no idea anyone was forced to use analog modes for communication. Perhaps you could enlighten us with what modes you consider 'analog' and where it's written that your forced to use them.. I'm sure your definition will be somewhere just left of the Orion nebula but I'd still like to hear it.

Rambo, please don't give the old, white men, all the credit, I'm only 35 and I'm tired of the old white men, aka old fartz, old foggies, getting all the credit for insisting "I had to learn it, so you do too". By the way, since you claim to have given up your amateur operations why would you care about newcomers to the hobby, your not talking to them anyway.

Well, I don't know what a 60 year old fog is but I love 30 meters
and have had lots of QSO's with both male & female CW operators in
their teens. Being a "young" operator, I average 100 QSO's/month
and the age of my contacts has been from 8 to 99 years. CW is NOT
a mode mostly used by old timers and anyone the thinks it is otherwise
hasen't the faintest idea of what is going on.

Anyone who can hold a CW contact knows there are plenty of young hams on
the CW bands. You said it Bub, anyone who thinks CW is populated with
"old foggers" doesn't have the faintest idea of whats going on. This is
a fact that is easy to verify...provided one can tune in and copy a CW
QSO.

REPLY...

With CW, its pretty hard not to be. It is rather difficult to carry on a heated debate using the incredibly slow CW mode. Instead, you're left with short conversations, with little real exchange of information.

With voice, I can communicate in 5 minutes what would take you a couple of hours to communicate with CW (20wpm? I can say 20 words in five seconds). Not only that, but I can better communicate the meaning of my words with the tone of my voice (a raised voice for anger, a low voice for sadness, etc.). Those concepts are very difficult to communicate with CW.

Using voice is the most natural means of conversation. It is what we humans do. We stopped banging on rocks as a means of communications thousands of years ago, shortly after we learned to use our voice. Perhaps amateur radio will eventually advance far enough for operators to stop banging on a "key" as a means of communications.

In the meantime, at least we can drop the morse code test so that the other operators, who have advanced beyond banging on rocks, can fully enjoy the entire amateur radio service.

REPLY...

An 8 year old could pass a driving test. But that does not mean they are qualified, of capable, of safely driving a car. In other words, they would not be a "real" driver.

Yet, we have CW users who suggest that all one has to do to become a "real" ham is learn CW (something an 8 year old can do).

This debate is not about the ability to learn CW, it is about the necessity of learning code to be an amateur radio operator. In all the arguments in support of CW, none have convinced me of the need for CW testing.

In fact, most of the arguments in support of code could just as easily be applied to a driving test. Perhaps we should have a CW testing requirement for the driving test (this would keep the "scum" off the highways, just as ligitimately as some argue the CW test keeps the "scum" off the HF bands).

> are so many knowledgeable people on VHF that conversations tend
> toward science.

REPLY...

And this is another reason I feel the CW test should be eliminated.

For many people, their license is an important part of their self-image. For these people, a higher license brings higher respect, prestige, status, and self-worth.

To these people, the person holding a lower license is less than they are, often in all regards. You see this in the argument that the lower licensees are a potential root of all evil facing ham radio today, hince we have to do everything to keep "those people" out of the HF bands, at whatever cost.

To some extent, this also explains the attitudes of many hams towards CB operators (CB operators have no license, so they are really low). To promote their own image of higher self-worth, these higher license holders have to resort to putting down everyone else whenever possible.

While I obviously don't agree with these attitudes, I still have to acknowledge the fact that these attitudes exist. Which brings me to the lowly Technician, often viewed as the lowest of all, expecially by the CW crowd.

Many bright, fully-capable, individuals hold that license class. Without the CW barrier, these people could easily advance to the higher license classes. They have the knowledge, skills, and abilities, to perform well, both on the valid theory tests, and on the radio.

The CW test barrier, which many feel is unnecessary, is the only thing keeping these people from earning a higher license class, thus gaining, in the eyes of many in the amateur radio community, the same respect, prestige, status, and self-worth, as the other higher license holders.

Technician class licensees amount to about a quarter of all ham operators. But, because of the CW test barrier, it is a license class

which offers no opportunity for advancement. If one has made up his mind not to study code, the other license classes hold no relevance (they are not something he can achieve).

Perhaps the FCC realised this when they offered so much to this license class (full VHF/UHF priviledges). And, as this license class continues to grow (it is the fastest growing license class), the HF operators will eventually lose most of their status.

Once HF operators become a minority (a real possibility considering the growth of the Technician class), they will quickly find themselves on the short end of the stick. Technological advances will shift to the VHF/UHF bands. Publications will center more on the VHF/UHF bands. In fact, the whole emphasis of ham radio will shift to the VHF/UHF bands.

And perhaps that is the real future of amateur radio. I hope, when all this happens, the HF band users will still consider the CW test requirement worth it. But, by that time, what will it matter (they will be a minority)?

Dwight Stewart (KF4URZ)

2917. FS: lightweight comm headsets

Newsgroup: rec.radio.amateur.misc

Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

I have two dozen Foster lightweight commercial quality communications headsets for sale. The first batch of headsets soldout quickly and I was able to get more but at a slightly higher price (which is still a bargain). Each headset is fully adjustable with one foam padded earpiece/speaker and articulated electret mic. The connecting cable is three feet long with a standard 4-pin mic plug with index notch on the end. Included instruction sheet show 2 interface circuit diagrams for use with Kenwood, Yaesu, Icom and Radioshack radios. $7 each (plus $3 shipping) or 2 for $11 (plus $4 shipping) prepaid. E-mail me with questions or to get my address to send your order.

Thanks,
Scott Adams

>There are many technical folks with no-code tech licenses that wouldn't
>be hams today were it not for the codeless license ... most of us who
>work in the electronics industry know many ...

I'm sure there are. But, for every one of these folk, there are dozens of non-electronics-industry-employed people. That is the problem with the way the codeless tech license was implemented, and is why I objected to it in the late 80's. I didn't have a problem with creating a license for the technically-literate, but the codeless tech wasn't that license.

>The form that the codeless license took (without HF access) STILL is a
>turn-off to many, since it clearly relegates them to "second-class
>citizen" status ... not to mention the insults and "No-coders aren't
>REAL hams" bigotry that many like you, Larry, Dick, and others spout ...

I don't believe I've made such a comment. However, whenever I hear this argument about the "technical elite" complaining about the codeless tech licensing being a "2nd class" license, I have to sit back and laugh. Having worked with my share of engineering primadonnas, I can just see these geniuses sitting around complaining about the *audacity* of amateur radio not giving them the highest license class immediately just because, well, they are them. How dare the pheasants (that's us) have a 'better' license class than those who sit atop Mount Olympus (that's them).

And, you know what is even funnier? Let's assume for a moment that we create a "codeless Extra" license. What do you think is going to happen when these geniuses get their codeless Extras? Well, a bunch of lids will start ragging on them, just like lids have done with the Novice enhancement licensees and the codeless tech licensees of recent history. So, they will *STILL* be 'second class citizens', as you call them, in the eyes of some.

> ... in fact, if your position here is any indication, you
>were probably at least as obstructionist as the ARRL in trying to keep
>the no-code license from coming into being ...

Of the two codeless tech licenses, I preferred the ARRL's 220mhz+ license.

>If you had open eyes and an open mind, you'd see that no-code techs are
>virtually the only source of growth in ham radio and that without them,
>our numbers would have taken a disastrous slide ...

There is no evidence of this assertion.

>Actually I can't off the top of my head ...

Of course you can't. Because the Codeless Tech license was a lie. Period. The codeless tech license wasn't about getting geniuses into the hobby to technically innovate, it was about getting people into the hobby with no code test so they could yack on the radio. And, likewise, the No-Code Agenda's Codeless HF license isn't about technical innovation on HF -- its all about being able to scream SEEEEE-CUEEEEE DEEEEEE-X into a microphone without taking a code test. Period.

>The no-code license was NOT created for the reasons you claim ... and
>it was not "sold to" incumbent hams ...

Reading the "letters to the editor" and editorials from magazines in the mid-to-late 80's paints an entirely different picture.

>hams were stagnated, code was no longer necessary as a qualification, and
>it was done *despite the objections of the ARRL* ... the ONE, lone time
>that the FCC had the balls to do something because it was right, even if
>the ARRL objected.

In case you've forgotten, the ARRL supported a codeless VHF license in the late 80's.

>Your entire "what's in it for ME" line of thinking relative to no-code
>licensing is shortsighted and narrow-minded (but that's your way, so I'm
>not surprised) ...

If I was really a "what's in it for ME" person, I'd be supporting Codeless HF. I've already aced (numerous times, with rote memorization only) the Extra-class question pool. Eliminate the code and I instantly get Extra privileges with zero work. Whoops. My CSCE expired. Guess I better go commit that question pool to memory again and get it renewed.

"R> Much larger and probably *much* more technically qualified.

NOT is what we have happening more and more on 2 Meters & 440 in direct proportion the NO CODE population increase is any indicator. I have never heard a bigger bunch of CB Brained IDIOTS. Yes soem are old timers but they are FAR outnumbered by the Later No Code Era Callsigns. KD6 and Later where I am. :-(

1.) Isn't CW (i.e., On-Off Keying) a "digital" mode of communication ?2.) If you don't like analog transmission, I guess you have no need or desire for that 2 meter FM rig you talk about so often.

I'm not a vet here, either - but I'd bet that's gonna change right now!
Here's my position (I like the term "DMZ"-and if you gotta ask, you're too young or
your memory's shot!): I'm a one of those *$%#%$% "No-Codes'; and frankly,
I'll probably NEVER take a code test! OTOH, I'm not a rabid "No-Code" -
I just don't care if the CW requirement stays in effect or not! If it goes
away, you'll hear me on HF- if not....no big deal.

(Short pause to douse the incoming flames!)

Frankly, I think it's ridiculous that Amateur Radio Operators will stoop
to the levels we witness on this NG. "WHAT WILL REALLY DESTROY AMATEUR RADIO..."
(in *my* opinion) is the reaction of a sufficient number of non-Hams who stumble
across the bulls**** (my term) generated in the arguments here. They'd probably
figure all Hams are a bunch of foul-mouthed pea-brains...after all, that's the
likely impression conveyed by at least half the postings.

Hmmmmmmmm, foul-mouthed peabrains.....that's a 'cleaned up' version of what
some of the more vitriolic "CW keeps us from being CBer's" advocates would
use to describe the "CBer's". Uh-oh.....that sounded like an opinion, better
get back into the asbestos underware! Well, by now there's about 1000
posts taking me to task for saying they're like CBer's. Time to duck!

Bzzzzzt - nope - but thanks for playing!

The band plan is regional for VHF / UHF due to propagation.
Look at the 2M band plan for Indiana and then look at the one for Michigan.
Better yet - look at Michigan and Canada!

Yes you have to know where you can and can't operate - I believe on 2M it is
between 146 and 148 Mhz.

IMHO the lack of a national band plan is a pain ...
but with a FCC regulated band plan - why not just put a channel indicator on the
radio?

No-Code Tech AND and ARRL member....

But if it were a requirement to get a drivers license, it would not stop
me from getting a such license. I would not whine and cry about it and
refuse to get a drivers license just because of the extra reqirement.

Somewhere in there is some truth I guess but it confused me. If the guy is not expired and his ticket isn't either, why is it we don't count him? I can see using current numbers in this case don't make sense when projecting future numbers because of the upgrade or die thing, but currently they are numbered. You may also wish to include those Gen and above who are still with us but no longer play with radios. In my area there are many of them due to the nature of the area which draws older folks much like Florida does and many of them just don't deal with the hobby anymore. Some still carry Vanity Plates but dont Beep or Yak.

"-The microphone at beginning, the antenna at the end"

O.K I ready for exam now Noda san ownree study for one day.
What about Receiver?

"-The antenna at the beginning the speaker at the end"

Tim san now know ebby ting needed for test day.
But I need know how packet radio work too,

"Digital System (or Packet Radio System in General)"

"-The antenna is located at the end to transmit or to receive (resonable?) "
"-The course of actions: you type (input/outuput)... the computer responces...
the modem responces...
the tranceiver responses... the antenna sends out the signal..."

Oh tank you Masataka Noda san, now Tim san know ebby ting needed for hai speed packet radio! I send .gif file to sattarite today. But one questions ownree, can I spams on Packet radio? Can I talk to Police and tell them harrow? Oh sorry that two questions. I send you $20 today dis is best prodaht in world for Basic Radio License. I ready for Advance license now ownree study CW for 1 day ownree.

> In mean time, if you have time to make the impression that I seem to
> be stupid, you should see yourself so you don't look stupid.

Well since you put it that way.... ROTFWTIME....

Ok, I know guys, I was a little rough with this one. Sorry, I won't do it again....I just couldn't help it. *flame suit on* :)

His 1942 figure is only 20 years after CW came into widespread use.

Your comment regarding "1800's Morse technology" would be similar to
stating that the voice modes are millions of years old, originating
with the first grunt of prehistoric man.

Rod, it would have been more responsive to answer his question.
And the answer is, only a national of the UAE can be granted an
amateur station license. You can get permission to operate as a
guest at the station of a national, however.

Progressed beyond the capabilites of the home hobbiest?I think building radios is easier now than it EVER was. Mixer/RF amps, high gain audio amps, all available in chip form.
PIC controllers available with inexpensive programming devices. Lots of new DDS devices that are easily controlled via a serial or parallel line. What more could todays enthusiast want? If your an appliance operator it's because you choose to be, not because todays electronics are beyond ones capabilities.

Neither have I. I hold a valid amateur license and have passed the code test. Like you, I would not let that stop me from obtaining a license. But I would also work to remove the irrelevant and unnecessary portion of the test for the benefit of future applicants. This is contrary to most of the old, white men in the pro-code camp who stubbornly insist that "I had to learn it, so you do, too." Never mind the fact that it is no longer relevant to communications in 1998 or that it is turning away badly-needed would-be newcomers to the hobby.

by a ham operator?

The ham operators on here will tell you that it most certainly is one of those awful, lowly, scum-of-the-earth CB'ers. Couldn't POSSIBLY be a ham operator creating interference here, now could it? Watch and see...

Raw NUMBERS, yes. But numbers of licensed amateurs...particularly no-code
Technicians, have been increasing much faster. Result: the percentage of
licensed amateurs who are affiliated with the ARRL is now at an all-time low.

Luckilly for you, that will never happen. If it did, amateur radio would lose approximately 25% of it's licensees and, consequently, large chunks of frequency allocations...if not outright abolishment of the entire service.

Nice try Rambo but there is a little more than just knowing the radios PLL chip.
After that I suppose you just tweak everything for max out eh? Actually I
converted one and knew nothing of the rigs PLL chip so try agian.

Well, it's actually quite easy, you see being lesbian (which she does not appear to be since she's dating men) has nothing to do with admissions to Stanford, nor does being ugly or the ability to stop a truck. So in all likelihood what the President does is write a check to the University once or twice a year to pay for tuition etc. Now you know HOW he does it.

CRT's. These appear to be new cathode ray tubes, some boxes still sealed. Don't know
what type of equipment these were used in. I'm sure some were for oscilloscope use.
Others probably some military application. Price listed does not include shipping from
Baltimore, Md. 4-3BP1@$5.00EA, 3-5FP7@ $7.00EA.1 ea of the following: 5CP1 @$7.00, 3JP1@$5.00, 5AXP4 @ $30.00(this is a general purpose TV service tube to hook up to a wide variety of B/W TV chs for testing) & 1-5BP1 @$7.00.
Thanks for taking the time to check this out.
John

What questions would you like me to answer Cutie boy? I haven't seen any questions to me in your posts.By the way, the only confusion seems to be in your study guides, I'll stand by my original comment. These guides are garbage, they are full of incorrect and misleading information and contain spelling and gramatical errors. Hardly worth the bandwidth required to download them.

<6av5qe$185$1@anomaly.ideamation.com>...
>
> The Codeless VHF license was supposed to spur technical innovation on our
> VHF bands.

There are many technical folks with no-code tech licenses that wouldn't
be hams today were it not for the codeless license ... most of us who
work in the electronics industry know many ...

> We were told that there were all these geniuses who were just
> chomping at the bit to get into amateur radio, if not for that nasty code
> requirement.

The form that the codeless license took (without HF access) STILL is a
turn-off to many, since it clearly relegates them to "second-class
citizen" status ... not to mention the insults and "No-coders aren't
REAL hams" bigotry that many like you, Larry, Dick, and others spout ...

> Okay, this sounds reasonable on its face, and since code is
> not required for access above 30MHZ, we eliminated it.

You didn't do SQUAT, Mike ... unless I missed something (and I don't
think I have), you've never been an FCC Commissioner, so *you* didn't
"eliminate it" ... in fact, if your position here is any indication, you
were probably at least as obstructionist as the ARRL in trying to keep
the no-code license from coming into being ...

> But, where are all the promised technical innovations on VHF? Its been
> 7 years now. Certainly we should see *something* by now.

If you had open eyes and an open mind, you'd see that no-code techs are
virtually the only source of growth in ham radio and that without them,
our numbers would have taken a disastrous slide ...

> Can you name one,
> single, solitary technical innovation created and contributed to the hobby
> by a Codeless Tech, which wouldn't have been implemented in the hobby if
> not FOR the Codeless Tech license?

Actually I can't off the top of my head ... but your entire line of "thinking'
is corrupted by your hatred for anyone/anything that doesn't support mandatory
code testing ... all I can say is that we'd be FAR worse off without the folks
that have been brought into ham radio via the no-code license than we are
today.

The no-code license was NOT created for the reasons you claim ... and it was not "sold to" incumbent hams ... it was created because incumbent hams were stagnated, code was no longer necessary as a qualification, and it was done *despite the objections of the ARRL* ... the ONE, lone time that the FCC had the balls to do something because it was right, even if the ARRL objected.

Your entire "what's in it for ME" line of thinking relative to no-code licensing is shortsighted and narrow-minded (but that's your way, so I'm not surprised) ...

That is ABSURD, Mike ... modern VLSI devices present entire building blocks
that can EASILY be used to implement systems far more complex and capable than
could have been done by the home-builder with the technology of 20 years ago
..

And for a hundred bucks you can have a complete suite of VHDL tools, including
design entry, design compiler, functional and timing simulators, synthesis,
programming tools, and the in-circuit programming cable to create your own
"custom"
ICs with 10s of thousands of gates in them ... at home, with your PC ...

I have several different "flavors" of such tools ... they are cheap, easy to
learn,
and easy to use ...

> Custom ICs, surface mount technology, high-density manufacturing techniques

No, ignorance, laziness, and the perversion of ham radio from what it is
supposed
to be (and used to be) into a radio-based electronic gaming field by the ARRL
are
what contribute(d) to making today's ham operator an appliance operator, not an
electronics enthusiast.

Hi Gary,

Though technically correct, your arguments fall flat in that this
isn't a technical debate, it is an emotional one (you've alluded to
this perception in other posts). The conclusion that CW is a fading
requirement for the commercial world is inescapable (market forces are
like death and taxes). Thus there can be no appeal to its real need,
but rather its perceived need.

Beyond this point on the page, Gary, mostly what follows may be
classified as "ranting and raving" and not necessarily direct response
to any particular posting. So, to continue...

One perspective of that perceived need is rather apocalyptic
anticipating a time when societal structures and standards have
collapsed. As irrational as the apocalyptic perspective may sometimes
become, it serves to establish a fundamental level of concern. That
concern is that like bio-diversity, whatever is lost can never be
recovered when the need arises.

CW presents a form of code, encryption, digitization,
whatever-you-may-call-it, that is commonly available throughout the
world. When I say commonly available, this can be as literal as

hearing someone define it. This constitutes an Oral tradition. It already has a protocol associated with it that is its own lingua franca (the Q code). This code requires no supplementary equipment to interface it to the user. Even more important, is that this code and protocol can be carried in your head, and practiced by hand. Being a primitive mode, it is not restricted to electrical transmission (lights, bells and whistles work as direct replacements within the constraints of range), nor does it require complicated synchronizations. As the mind is the ultimate signal processor, interfering signals are managed with far greater sophistication than the best digital techniques that require co-operation. This is not to say that the mind can outperform digital processes, rather it says that in an uncooperative, chaotic state, the mind will recover more data than a digital process.

However, even here my apologia leans too heavily on a technical rebuttal. The proper response should be couched in terms of the bio-diversity allusion. The real world demonstrates total disregard for issues of bio-diversity everyday, so how does this allusion impact this discussion? For those very reasons of disregard. Just as the passing of a genome from our genetic pool is an irretrievable loss, so is the lost knowledge of a process an erosion to our cultural memory. As the commercial world discards this mode, it is OUR RESPONSIBILITY to maintain it. This is a REQUIREMENT OF OUR CULTURE, or our culture is meaningless and renders us as merely a class of technical hedonists.

The stumbling block of this discussion also lies outside of the technical discussion. That block is the practice of selective discrimination against non-code operators.

That block should remain. For a culture, it serves as a necessary rite of passage. It fosters the education of our oldest and venerated mode. Through the restrictions of the band plan it fosters its use. As a distinction in one's standing within the culture, it should be retained as a requirement for advancement. However, as a segregating principle insofar as HF/VHF privileges, this is not a cultural necessity, but rather a legalism. That legalism, in light of today's practices, has been rendered meaningless and serves only political goals.

This block then should be revisited to remove not the cultural mode but rather remove the outdated legal restrictions. In fact I would open the floor to discussion of Amateur Radio acquiring title to the entire HF domain. Where there are existing commercial services in use, they can share with us as a secondary user on a mutually non-interfering basis. I'll trust that Hams will honor their rights more than they would observe ours. This band-grab could not come from our own efforts, as we are barely able to scrabble for what spectrum we have. No this move would have to be patronized. It is incumbent upon the governments to grant us this spectrum as THEIR OBLIGATION to

aid our support and fostering this mode; to encourage public participation; and to hold the spectrum in the Public Domain.

Aside from that last wild fling of imagination, CW policies involving discrimination should be examined at all levels, not removed. Priorities may change over time, but what society discards it's heritage?

Warning: This isn't the answer you want to hear, so if you're easily
offended, skip my reply now....

Even if you do "track down" the source, there is no guarantee that it is
the "guy's" problem. The problem could entirely be *your* equipment.
Do you have a VCR connected to your TV? VCRs are well-known for picking up
stray RF emissions. Unfortunately, manufacturers of today's electronics
equipment do not put sufficient shielding in them to prevent them from
picking up stray emissions from other sources. If you open the Owner's
Manual to your TV/VCR/Stereo, you'll see an "FCC Part 15" notice which
states, effectively, that your electronic item may act as a radio and pick
up stray emissions. If so, it will tell you to try "reorienting the
device".

Hi Ed,

My point is simply this: amateur radio licensing figures are *always*
overstated. The reasons are quite simple:

1) dead people are still listed
2) inactive people are still listed

Currently, the codeless tech license figures are overinflated because
the first round of license expirations for that license class are not
slated to hit until 2/2001. When the codeless tech license was first
created, it saw tremendous growth, with 3,000+ new licensees coming
in each month. Today, we only see ~800 new licensees each month, and
the codeless tech license category sees ~250 upgrades to higher license
classes each month, for a net increase of ~550 licensees each month.

It is my firm belief that when 2/2001 comes around we will see a major
drop in the number of codeless licensees. Why? Just personal observation.
The only N1xxx tech callsigns I consistantly hear on the radio (my club
sponsors a 2 meter repeater which I monitor regularly) are "new" N1
calls. I can count on my fingers and toes the number of other N1
"old-timer" codeless-tech callsigns (from roughly N1Jxx forward) I hear
regularly. This personal observation implies that many of the codeless
techs which became licensed have either moved on to other activities
(doubtful, since there is no increase in packet/ATV/440 activity here)
or have become "inactive".

A while back, Jim Kehler posted an excellent message summarizing why
he felt many codeless tech licensees would become inactive. The premise
was basically that the codeless tech license created a license class
for people interested in a "family radio service" type of license, rather
than for people who were interested in radio. As such, many people

got codeless tech licenses only to find out that ham radio really isn't what they were looking for.

Based on my personal observations, I believe Jim's summary to be accurate.

On the other hand, people who obtain higher license classes are, by definition, interested in radio, since they are pursuing an upgrade (do not turn this statement into a pro/no-code argument, all I'm saying is people who move up in license class are obviously still interested in radio, otherwise they wouldn't be upgrading -- whether they use code or not once they get a higher license class is irrelevant to the point I am trying to make.)

Thus, I think it is a safe assumption to make that the relative rate of licensee loss circa 2001 will be higher in the codeless tech license category than in higher license categories.

This is one reason I believe the No-Code Agenda is pushing so hard right now for Codeless HF. They have to "strike while the poker is hot", so to speak. By virtue of over-inflated license statistics, they can create the illusion of more support for their position than there really is.

Even though I favor the retention of code for license requirements, I would not equate the none-code Techs with CB. I would rather -- much rather! -- see 1000 none-code Techs on the air in lieu of just one butthole who thinks that music, foul language and bad manners are required to demonstrat your BIG SIGNAL.

>There is more public service communications taking
>place on the HF bands than the No-Code CB'ers do
>playing around on the FM repeaters.

As a former state warning/communications officer directly involved in emergency communications, I can state emphatically that this is not true. To say that coded or none-coded, HF or VHF, voice or CW, young or older or *any* part of the emergency communications system does more than others does a great disservice to the system and the people who make up the system. We desparately need *ALL* of these components to maximize our success. Some people who have not been DIRECTLY involved in emerg communications (either as an operator or as a planner) just do not understand that each facet of ham radio is a tool to be applied where it best fulfills a need. My guess is that you have never been involved in planning for emerg mgmt/civil defense/diaster communications.

In PA the county emerg mgmt offices were asked/required to develop an emergency communications plan that INCLUDED Amateur Radio. In the early 80's we even successfully procured federal matching funds for Amateur projects.... like VHF repeaters and HF all-mode xcvrs!

Arguments you make for or against retention of code testing carry less merit
when you append spiteful comments such as these.

2964. Radio Control Programs....bad stuff?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-31 00:00:00 UTC

Source record: 179975
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.amateur.equipment

Hi there!

Well, I tried a lot of these so called 'rig control' programs BUT:
I was amazed how BAD they really are:
- inaccurate
- user unfriendly
- just 'bugging' around (full of bad bugs)

I tried (on my NRD535D):
- ScanCat Gold for windows (Is this program really ment for ease up tuning ....? Don't got it to work very good, and it locks up the serail port for other programs (after quitting it).
- RCON v2 is VERY BAD: full of bugs (BWC simply is sh*t); cannot expand the screen to max-size, just gets back to org size;refuses to read it's own dB; doesn't work with Klingenfuss 1996; levers just disappear; no possibilties for offset setting. Really DOESN'T support the NRD at all! Left out some main features
- Freq Manager 2.0 (Can someone please test programs on their quality there?? It's very inaccurate!) Full of misspelled words. CAT (the tuning itself) just doesn't work. But a great database!!!!!! Most features left out (BWS, ECSS etc)

- NRD6.2 The only positive thing I found (and started with) is NRD6.2 from Tom Whiteside... The only disadvantage is that the databases are limited to 7000 records each. So you have to chop the stuff up. And it's DOS based, but ok, who cares after all the other programs.

-Turbo 53x : And a fairly good program is that of Jan Arkesteyn: Turbo53x.Zip
It runs well under both windows, but the databases are somewhat limited...The conversion procedures with it are simply inhuman .... Im gonna see if there's something to do about it....Still I guess this program has the best perspectives for the windows-based users

The LAST TWO are the best for the NRD5x5 to my opion, and THEY ARE FREE!!!!
So, if you have a NRD, don't bother to buy any of these programs, but go for the free stuff.

Are there other programs out there that support the NRD535 or others good and do what they say???

Im curious to your experiences...

Thanks a lot

Kees van Engelen

If the "transceiver" could actually be in 3 boxes, I'd vote for the T4X, R4C,
AC4 from R. L. Drake. I'm not nearly as impressed with Drake's actual
transceiver products and might lean toward something by Swan instead.
Even the Galxay V Mk II was a potent little package which has its points
compared to a TR3 or TR4. The Collins KWM-2 was cranked out by the
ton to meet government contracts, but it wasn't really a very good radio
compared to some of the others.

Now, many pro-CWers say CW requirement won't make good hams, but who actually uses the CW are better hams (?) than the other hams (ie. 80m band).

Now, then what's the purpose of CW requirement ? You can't kick the garbages out because it doesn't "filter" bad hams right ? What are you going to do about it ??

hi.

we don't care nor interested in how the CW works.

we use digital. we don't like analog and i don't know why we have
to be forced with analog.

we can use CW. we don't use CW. we can use satellite and we can
use digital. we don't have to know how the CW works and we don't
have to be forced with it.

---

some say casette tape recording system is better for computer instead
of floppy disk. we just don't care. you look silly if you try to
force this obselete method.

>have one choice of license class. It's that simple.

that's why we are trying to change it.

in 50s, many countries were having wars and the law required you to go
for war.

If you don't like, or don't believe in war then you had only one
chance. Die... or at least go to jail.
It was right to have wars and it was right... everything what the
government said was right. Think of Japanese and German totalitalism.
If I was in Japan at that time and refused to go for the war, they
took my head off. It was right and everything was right... you
were required and you were supposed to.

I am sure you will happy to live under the kinda totalitalian
government. The law says so, so you have to do so.

You were doing real good until that last para Tim, then you just had to
give the guy a new name. BTW, he is correct, not many people in the
world know morse code. And guess what, those that do are departing this
earth faster than new ones are learning. Since the military and other
services no longer use OOK no one feels compeled to learn unless of
course they want access to HF. And that rate, for the present is going
to decline.

Tyhe system is a joke. It was broken a long time ago. Fortunately, people are finally starting to wake up and take notice. Only problem is that they do not always respond in the most effective manner when they do realize how corrupt their government has become. This is what the Oklahoma City bombing was all about.

2983. WTB: Kantronics Ham-Text or AEA MBA-TOR cartridge for C-64

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-31 00:00:00 UTC
From: te@4u.net
Message-ID: <34d27a5a.10083210@news.concentric.net>
Source record: 180003
Cross-posted to:
rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

I am looking for either a Kantronics Hamtext cartridge or an AEA
MBA-TOR cartridge for the Commodore 64 computer. I would also be happy
just getting a copy of either program on a commodore floppy disk. I
want to get my old C-64 back running for RTTY use. I am also looking
for an AEA CP-1 RTTY interface with manual. Would also consider a
CP-100. Please reply via email.

Come on ... get real ... the attraction of HF is PROPAGATION and what can
be done there (and I'm NOT talking about calling CQ Contest or CQ DX) ...
and there is much work to be done in improving the utilization of (and
performance of equipment/modes for) our HF bands that can ONLY be done by
USING those bands, since the variability of the channel impairments associated
with ionospheric propagation modes is virtually totally absent at VHF/UHF ...

Doesn't have to be a full-blown PC, though they are getting cheap unless
you *have* to have the latest and greatest 300MHz MMX 128MB RAM 8GB HD
super-wiz-bang dual CPU dual PCI bus screaming monster ... a $2.00 (or
less) microcontroller chip can handle the basic protocols ... and DSP MIPS
are cheap, too ... one major DSP manufacturer recently announced a 100 MIPS
DSP designed for inexpensive consumer electronics that sells for under $5
(that's five bucks) in modest quantities ...

Why? I would submit that folks would be FAR better served in today's world
by acquiring some computer skills than learning a piss-poor, manual encoding
and decoding scheme from the 1840's ... jeez ...

> It would suck carrying a computer around for communication on, say,

Crap ... my Palm Pilot fits in my shirt pocket, does serial communications (not
to mention handwriting recognition) has more than enough horsepower, display
capability, etc. to serve as a terminal, and runs on 2 AAA alkaline batteries.
I've had the damned thing for over 2 years now and I'm just now starting on my
4th set of batteries. (In other words, 2 AAA cells have operated the thing, on
average, for nearly 6 months ... and I use it every day.) Only slightly larger
than your cigarette pack ...

NO, I'm saying "compared to OOK Morse, certainly."

> I agree that FSK under rough conditions and with weak signals could be easier
> to copy than straight OOK CW. But we are then back to two separate tones.

So what? At OOK Morse-like signalling rates, they could be spaced VERY close
together and with proper shaping of baseband data the spectrum could be
narrower
than the necessary bandwidth for OOK Morse ... that's the point that you are
missing (or choosing to ignore ... I'm not sure which is the case) PSK could,
of course do even better, but is admittedly a tad more complex to demodulate
than simple FSK ... though a PSK modulator is flat-out simple.

> Again, your last statement is pretty much true. I think I read something
> somewhere about FSK morse. sounds good to me cuz nothing is ambiguous... i.e.
a
> lack of signal could not be mistaken for a space if one of two tones is
> required to be present at all times.

You appear to be *starting* to get the drift of what I'm trying to tell you
... the lack of ambiguity gives a 3 dB advantage for starters, and there's
more where that came from ... quite a few dB more that are "easy pickings."

> And again, you are back to using more
> bandwidth than CW. due to having at least two distinct tones.

NO, NO, NO!!!!!!!!!!! Read above about signalling rates, tone spacing,
and required bandwidth ... also read Gary's excellent posts on required
bandwidths for OOK Morse and the advantages of "fully-voiced" modulations
(which is what you are getting to in recognizing the advantages of using
two tones vs. tone/no-tone) and the advantages of uniform codes, matched
filters, etc. ... read Shannon, Nyquist, and others ... learn something
about modern communications systems design, information theory, etc.,
rather than wallowing in demonstrably flawed/false Morseodist dogma ...
(sorry ... I started to rant at you a bit here, but it is ***SO***
frustrating when people effectively walk outside on a clear day, look
up at the sun, and proclaim "Damn it's dark out tonight!")

> I'll tell you what, Carl. Come on down and find a dumpstered computer
> anywhere in the valley. I'll buy it from you.

What valley are we talking about here? Besides, it's a moot point with
you, since you already have a freaking computer ... put it to use.

> Morse code was invented in the 1840s ...
>
> CW wasn't

When people say "CW" they *really* are referring to OOK Morse ...
let's not split hairs here, since we BOTH know what the hell
we're talking about ... the fact that Morse is transmitted by
keying an RF carrier on and off rather than keying a DC circuit
over a pair of wires does NOT make Morse code "newer" ... it is
ancient, demonstrably poor signal/coding design, and cannot be
justified as a mandatory requirement for licensing of ANY kind.

> Nobody is forcing Morse on anybody.

Aw, come on ... be honest enough to admit that today the
rules are "If you want to use HF, you *have* to learn Morse
whether you want to or not." That *forces* anyone who
wants to use HF to learn Morse, even if they think it is
a stupid waste of time because they are NEVER, EVER going
to use it ... huge numbers of today's HF licensed hams
jumped through the hoop and haven't used Morse since ...
a pointless waste of time, energy, and wetware "CPU cycles"
that could have been FAR better spent actually learning
something useful or planning/training better for emergencies.

> Well, Baudot might be slightly more painful to learn, since every character
> would be 5 bits. Not so many easy ones. I think morse is still ideal for ear

You missed an important and revealing point ... the ARRL survey showed
that only 27% OF HF-LICENSED, CODE-TESTED hams use Morse "regularly"
1% did not answer, and the remaining 72% said either "never" or "rarely."
Again, this was code-tested, HF-licensed hams, not counting all of the
no-code techs ...

> Wonder what the population of hams will be if CW is eliminated as a test

Bellows <abellows@idog.com> wrote:
>And actually, it is not even a language, just a more slow and

You say that because your code speed is so slow. After awhile, you don't hear the individual letters, but rather, entire words. When someone sends say, -.-. ...., the idea "chess" enters my thoughts - same mental process as when I finally became proficient in Vietnamese - no longer did I have to translate "an com" to the word "food" - instead, the mental picture "food" entered my thoughts.

Keep working on your code speed, Bellows, and you'll come to the realization that your remarks are false.

A CLASSIC COLLECTABLE VINTAGE AMPRO REEL TO REEL RECORDER

I can email a color photos of the unit for your
review, if you wish in the .jpg file format.

AMPRO CORP MODEL 758 TWO SPEED HI-FI REEL TO REEL TAPE
RECORDER -- MID 1950'S IN NICE PHYSICAL SHAPE
ORDER, but will need apparently minor adjustments & lube.

- GREAT 1950'S ERA BEAUTIFUL STYLING & DESIGN WITH:

- GREAT UNIT FOR REEL TO REEL COLLECTORS OR FOR SOMEONE
WHO JUST WANTS A GOOD OLD FASHIONED HIGH QUALITY MONO
UNIT.

The interior panel is like new and the case is very good with a
few scratches on the bottom and some minor dings, etc, but very
minor for a unit of this age. We're talking about 40+ yrs!

Unit needs adjustment/attention--The playback is sluggish at either
speed,
thus slurring the words, etc. This will require attention.
Have a copy of the SAMS PHOTOFACTS repair manual for it.

$75 plus U.S. Parcel Post Insured shipping cost, which isn't
much. I'll pack it free.

I can email a color photos of the unit for your
review, if you wish in the .jpg file format.

Thank you.

Well here is a quote from your "Amateur Radio and Professional Radio Certificate Exam Information" document.

"By the government regulations, all aircrafts in air and the air traffic control must have at least one person who holds the radio operator's certificate for aeronautical. For your information, for the aircrafts, usually, the pilots hold the certificates. Nowadays, the pilots operate the aircrafts and communicate with air traffic control at the same time"

Buddy, if this was taken directly from an exam, or study guide Canada is in a heap of trouble.
But we both know this didn't come from a Government publication now don't we.

Damn Masa, I bet your parents popped the cork when you got on that plane for Vancouver. I can almost hear your Dad giving a hearty Howard Stern "hee hee Yeeeaaaa Babyyy" as the plane door closed.

Information about DUBUS Magazine and books

DUBUS is a quarterly published 100 page magazine
entirely devoted to DX-ing on VHF/UHF and Microwaves
(50 MHz .... 241 GHz). Fully bilangual written (English and German)
by active radio amateurs for active radio amateurs.

Subcription rates for one Year (1998):
Europe: DM 35,- / USD 22,- (cash or Euroceque only)
Overseas Airmail: DM 50,- / USD 30,- (cash only)

DUBUS book TECHNIK 4 (Technical reports collected from
DUBUS magazine 1992-1995: Preamps, PAs, Transverters, DJ9BV-Yagis...)
Europe: DM 30,- / USD 20,- (cash or Euroceque)
Overseas Airmail: DM 40,- / USD 25,- (cash only)

DUBUS magazine
Sample copy (anywhere): USD 5,- / DM 10,- (cash only)

Please send your order to:
DUBUS, Gruetzmuehlenweg 23, D-22339 Hamburg, Germany

Many greetings from Hamburg
Joe, DL8HCZ
Manager DUBUS Magazine
E-mail: FUNK-TELEGRAMM@t-online.de

3001. WANTED KENWOOD TS 430 V INFO

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-31 00:00:00 UTC
From: Swtempo@worldnet.att.net
Message-ID: <6aulh6$cct@bgtnsc02.worldnet.att.net>
Source record: 180021

I'm looking for any and all mods and info on this rig.
Is this rig the same as the 430 S???
Will the mods I've found for the 430 S work for this rig??
Please email or post any info or links to web pages you may have.
Thank you very much!!

email swtempo@worldnet.att.net

MANY years after 1800's Morse technology, or did you think Morse Code is
something NEW just invented in the 1990's?

>

First of all, thier offices would probably be closed, and even if not,
what help could they provide from another state? I love the way you
people always have to come up with the most ridiculous situations in
order to show a usefull instance for Morse Code!!

How about this one, Some vandal ripped off the touch tone pad and
switchhook, and the payphone was continuously connected to a dedicated
line to the Police station in town where no one understands Morse Code,
and the only way to ask for help is by speaking into the mouthpiece?

Or how about, you are stranded in a city where the local ordinance
prohibits the use of Morse Code, you are stranded in your car with a
radio in which the Code Key is broken, the wires are cut off and you
have no tools, and the only way to ask for help is via the microphone on
your 2-meter radio, or via your cellphone?

I can make up just as many ridiculous situations as you can. But the
actual emergencies that I read about in QST always mention 2-meters and
repeaters, but NEVER mention Morse Code.

A Blizzard where a Phone Booth is the ONLY sign of civilzation in view,
and the Mic cartridge is missing!! You had to really make-up an
INCREDIBLE situation at the North Pole to find something usefull for
Morse Code eh!

> to repeat it.

Not true, First of all I don't HAVE a cherry tree to chop down, and
second of all, We find out now that all these silly stories that our
teachers told us in History are not even TRUE!!

> 2.) To write, you must be able to read (and therefore have
> been exposed to some literature).

If you learned how to write by the ancient literature assigned by
English teachers, no one in today's world would understand what you were
trying to say. Not too many people write like that in this century.

>
> 3.) a minimal level of physical conditioning is necessary
> for even moderately good health.

Running around a football field for 45 minutes non-stop in the winter
wearing gym shorts and a t-shirt is not going to promote good health,
not is Swimming laps 45 minutes non-stop after your lunch period!!
Or how about having a kid hit a rock hard ball with a wooden bat, while
all the other kids stand in FRONT of him in the direct path of the
flying ball!! "Dodge Ball" also comes to mind!! (The object is to
throw balls real hard at other kids.) REAL HEALTHY!!

>
> What else did you miss out on? Logic???

No, YOU forgot that one.

-

It probably has, Jay. You can try W5YI group in Dallas. They sell reprints. Aslo you can get it straight from the GPO or a GPO bookstore. There is one in most major metropolitan centers. There is one in Houston, for innstance. W5YI Group, also going by NRE, National Radio Examiners, advertises in QST and other ham mags. I bet they will be happy to inform you if there is a newer revision available. They want your business, after all.

Don't go in cold, as the COLEM will charge you about $70 on average to take the test, and you don't want to waste it with a failing score. Do brush up on the current questions. Aditionally there is I believe a $35 application fee.

Contact the COLEM you plan to use for testing. They whould know the date of the last revision.

A curious thing about that Q&A pool is that all the technical stuff and much of the operating stuff is lifted word for word, Q&A for Q&A from the Advanced and Extra class pools. These questions were already tried and tested so this was easier for the FCC. For the Radiotelegraph elements, GMDSS elements, and Radar, I think they had some overworked stiff hammering them out on his lunch break. There were a LOT of wrong answers listed as the correct one, a lot of ambiguous or inaccurate grammar, etc. El. 3 was straight-up, thoughh, and element 1 was not too bad. You will be taking both of these elements unless you already hold a current Marine Radiotelephone Operator's Permit (MROP)

_/ _/ _/ _/_/_/ _/ _/ _/ _/
-
Here is a summary of news items covered on edition #253 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 6-Feb:
-
1. Andy Thomas, KD5CHF, Squeezes into Not-So-Cheap Space Suit
2. Barbara Morgan Appointed by NASA Newest Teacher/Astronaut
3. Phase 3D Satellite Could Fly "Stand-by" on A503 in May
4. Well-liked FCC Official Retires After 26-Year Career
5. Recovery Efforts Continue in Northern NY and New England
6. Hams Assist Red Cross in Fire Aftermath
7. Weekly Propagation Forecast
8. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
9. Special Event Station Calendar
10. "The RAIN Dial-up" from Chicago
11. Bill Continelli, W2XOY, Featured on WWCR 1/31 at 10 PM EST
12. * NEW * "Packet's Best Kept Secrets" with Bill Baran, N2FNH
-
Funding for the program's transmission and production expense was
provided this week by a grant from Gene Wicklund, W0ZOK, of
Horace, North Dakota, where "This Week in Amateur Radio" is heard
via satellite Saturdays at 8:00 PM along the Red River Valley on
the W0ZOK repeater on 443.75 MHz.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The
program is heard on the "W0KIE Satellite Network" each Saturday
at 9:00 PM (EST) on the Hughes Communications SBS-6 commercial
communications satellite, transponder 13B upper, located at 74
degrees west longitude in equatorial geosynchronous orbit. The
transponder center frequency is 12.019 GHz; tune up in frequency
to 12.031 GHz. Program audio is on the 6.2 MHz analog
subcarrier. A fee has been paid to W0KIE for access to the
satellite uplink.
-
On the WorldWide Web, program audio can now be found in several
formats (including streaming audio) at http://www.roava.net/twiar
through the courtesy of the Blue Ridge Video and Digital Society
```

of Roanoke, VA, and at http://user.icx.net/~ke4hsm/twiar.html with thanks to Greg Williams, KE4HSM, of Knoxville, TN. The service is carried on VHF/UHF repeaters throughout North America and by WA0RCR on 160 meters at 1860 kHz. Contact your local amateur radio club or repeater operator if "This Week in Amateur Radio" is not being heard in your area.

-

Production and transmission expenses are underwritten by donations from repeater operators, amateur radio clubs, and individuals. Further information is available from George Bowen, W2XBS, at 518.283.3665 (packet @ WA2UMX.FN32AW.NY.USA.NA or email kxkvi@delphi.com) or Stephan Anderman, K2SMA, at 518.664.6809 (packet @ N2TY.FN32DW.NY.USA.NA or email sanderman@delphi.com).

3007. Info on Sommerkamp FT 250?

>No, there is a third force, which I suspect is in the majority. That
>is those of us who are damned sick and tired of seeing the same old
>Code/No Code arguments trotted out for the umpteenth time,

Amen!!!!!!!
I respect the participants right to say whatever they want. I, too, am a "lobbyist" and I make certain my voice is heard on subjects which are important to me.

However, the majority of text on the subject of Code/No Code is, as you say, endless repetition. Nothing new is being added to the debate. In fact, it seldom qualifies as a debate--it's more of a shouting match.

A couple of folks in here have indicated that this is not the only forum they use to advance their position. That's wonderful, and I respect that. But for most of the participants, I fear this is similar to the voter turnout record in this country.....

Polls on any subject ususally find about 18% with no opinion. That means 82% of those polled HAD AN OPINION on the subject. But when it comes time to go to the ballot box, voter turnout in the United States is DISMAL. Often only 10 to 40 percent.

So I will echo what others have said. If you have a strong feeling about the Code/No Code issue, don't just put it on the newsgroup. Spend your efforts and time where they will do some good. Write to those folks who can have an influence. And don't just quit an organization that doesn't agree with you on everything. Work from the inside to change it.

Example: As an ARRL member, I took exception to the League's support of the Kenwood proposal to sell Amateur equipment in truck stops. Instead of quitting, I worked as a member to change the position of the organization. To the credit of ARRL, the League stood up to one of it's largest advertisers and stopped promoting the proposal.

So WRITE. But TARGET YOUR MESSAGE. In addition to QST, I have been pleased to see my comments on various subjects printed in Popular Communications, the Wall Street Journal (twice), and National Geographic. I enjoy the newsgroup, but you can take it to the bank that the ARRL, the FCC, and my legislators know my stand on Code vs. No Code.

That's fine. Most of us don't think it's fun...and more importantly, do not believe that an entire test element in it's proficiency is justified. We don't test for proper digipeter or packet operation, so why Morse code?

"Where's that big 'ol CB RAMBO??"

Ever hear of free enterprise? It is perfectly legal and acceptable for Kenwood
to sell their products in a truck stop, shopping mall, airport concessionary,
or wherever else they choose to. It is the individual BUYING the radio who is
responsible for it's proper and legal operation.

Typical of our deteorating society these days. Everyone's a victim, nobody's
responsible for their actions, we need the government and the ARRL to protect
us against ourselves.

Yes I am. They allow the ultimate in weak signal communications.
They allow the maximum content transfer under a given set of
conditions. And they are the most robust in the face of interference.
They allow us to operate at a lower power and with less expense
than do analog methods. And that allows a higher density of operations
in a given amount of spectrum which benefits everyone.

>Is digital only good for one-on-one contacts without 200 stations trying
>to make contact?

What you are describing is precisely the situation a server faces on a busy LAN when a number of processes attempt to communicate with it. Good digital protocols arbitrate such situations so that the requests que up in an orderly fashion and are handled with the least conflict. This maximizes the utility of the available spectrum. In a peer-peer network, this is done using p-persist backoff alogrithms. In a master-slave network, it is done by token passing.

The same techniques can be applied to amateur radio Dx gaming. Of course I'm afraid that the traditional Dxer won't appreciate it because it turns a competitive situation into a cooperative situation, and Dxers abhore cooperation. That's why the digital Dxer crowd still uses RTTY instead of a protocol mode which would enforce cooperation. It is a machismo thing, a power game, and protocol modes remove the advantage of excess power and aggressive behavior.

You're absolutely right, Carl. I agree 100% with what you say in this
paragraph.

However, I pose this question to you:

The Codeless VHF license was supposed to spur technical innovation on our
VHF bands. We were told that there were all these geniuses who were just
chomping at the bit to get into amateur radio, if not for that nasty code
requirement. Okay, this sounds reasonable on its face, and since code is
not required for access above 30MHZ, we eliminated it.

But, where are all the promised technical innovations on VHF? Its been
7 years now. Certainly we should see *something* by now. Can you name one,
single, solitary technical innovation created and contributed to the hobby
by a Codeless Tech, which wouldn't have been implemented in the hobby if
not FOR the Codeless Tech license?

Given that the Codeless VHF licenses has not produced any technical
innovations, why should we create a Codeless HF license with those
same expectations?

It is simply not logical.

not FOR the Codeless Tech license?

Better question: how many earth-shattering, technical breakthroughs have been created by ANY ham in the last 7 years...coded or not? Very few, I'll bet. These days, it's the computer nerds that make the world go 'round. Ham operators ceased to be important contributors to cutting-edge technology LONG ago!

3018. Rain Dial-up for week of Jan 30, 1998

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-31 00:00:00 UTC
From: arnoldr@ollie.ralabs.com
Message-ID: <34d26623.1870725@news.axess.net>
Source record: 180088

The following is posted here at the request of Hap KC9RP who currently does not have newsgroup access. You can contact Hap directly about the RAIN Dialup at:

hholly@ollie.ralabs.com

The RAIN Dialup for the week of January 30, 1998 features:

"Web-Controlled Kenwood TS440S"

Have you dreamed of listening to the radio spectrum (100 Khz to 30 Mhz) hundreds or thousands of miles away? It's now reality via the Internet.
RAIN Founder/Producer Hap Holly/KC9RP interviews central New York resident Bob Arnold/N2JEU about his web-controlled Kenwood TS440S. (12 minutes, 46 seconds)

The RAIN Dialup updates Fridays on the worldwide web at rrsta.com/rain. A 28.8 or faster modem is required for our Real Audio 3.0 streamming audio there. This program will be on line through Thursday evening at area code 847-827-RAIN and rrsta.com/rain. The RAIN Dialup is copyrighted 1998, all rights reserved. Audio distribution of this service is licensed to the following:

Internet: Bohnhoff Mediacasting (rrsta.com);

H.F.: the WA0RCR 160-Meter Gateway Radio Newsletter (Saturdays at 8 PM central on 1860 Khz AM from Wentzville, Mo);

satelite: This Week in Amateur Radio (9 PM Eastern Saturdays on SBS 6, 13B Horizontal, 5.8 Mhz audio).

unrestricted local VHF/UHF over the air dissemination of the RAIN Dialup is encouraged.

3019. Reset of MT1000??

I know. They have the natural resources and educated population to become a major economic power. But they suffered for nearly a century under a political system which wouldn't let them create a dynamic economy, and now they have a chaotic power vacuum as they try to transition to a market economy. It's going to be tough because they have a legacy of neglected infrastructure (both physical and institutional) to build to get to a competitive situation.

An example of the problem can be extracted from recent headlines. The Russian telephone system is *the pits*. The cost of bringing it up to Western levels is prohibitive, so the Russians have wisely chosen to jump over the wired stage and go directly to advanced wireless phone service. They've contracted with Qualcom to install CDMA PCS systems. But institutional problems have caused inordinate delays and cost overruns. The most recent example was of a Qualcom employee arrested for using a GPS receiver to survey a coverage area. He needed to know where things were, so obviously he must be a spy. Sheesh!

>>I'm not surprised. Russia is a third world economy which attempted
>>to field a first world military. But aside from the trappings of nuclear
>>weapons and missiles, it never succeeded.
>I've just returned from Krivoy Rog in Ukraine, part of the former USSR,

>to what the present military are up to in their supposedly secret
>underground bases in this country. Right up there with the HAARP
>project, and they're not looking at the damn weather.

Heh, HAARP is hardly high tech, just high power. I'm well aware that the ex-Soviets developed some impressive technical weapons. As I've noted, they have the brain power. But what they lack is the economic infrastructure to widely deploy advanced technical systems. For the bulk of their forces, they have been forced to try to make up in raw numbers for what they lack in ability to mass produce advanced technical systems.

During the Cold War, a number of analysts suggested that raw numbers was a substitute for high technology that would rebound to the advantage of the Soviets. But the reality, demonstrated again

and again in the Middle East's wars where front line equipment of
both sides clashed, was that high tech wins, and wins in a dramatic
and overwhelming way.

>> Much of its infrastructure
>>is still primitive. They even still make vacuum tubes over there.
>Yes, Sylvania, in St Petersburg is the worlds largest tube manufacturer!
>> But
>>they do know better. Some of the best data algorithms have come
>>from Russians. They just don't yet have the microelectronics
>>infrastructure to field them properly on the necessary scale. We
>>don't have that excuse.

St. Petersburg is a good example of the contrasts. On the one hand
you have a plant making trailing edge technology. On the other hand,
you have a cottage industry of programmers writing sophisticated
video games and advanced software systems, mostly until very
recently using only pencil and paper. I've been working with one
of these groups for a few years. They just couldn't obtain computer
resources at any price. Now we've been able to get some Tiawan
clone machines to them, and their productivity has skyrocketed.
But they still can't get a simple dial up modem connection to work
through their antiquated phone system. They've been talking to
us about wireless solutions to bypass that infrastructure problem.

>Laser eye surgery was also pioneered in russia, around twenty years
>befor the west.

Yes, but the average level of their medical care system is appalling.
Doctors Without Boundaries has been sending teams over there to
give health care to their citizens for a while now. What they've found
has been shocking, IE hospitals without even the basic medical
supplies and with equipment dating to mid-century or earlier. Their
staffers *know* better, but have been unable to *do* better because
of the dismal condition of their economic systems. The legacy of
communism still weighs down their efforts to modernize. Things
we take for granted here, like a MRI machine in every hospital,
are largely unknown over there. And that isn't because they don't
know how to build them. The tokomak technology that they invented
shows that they clearly have the knowledge and ability to produce
them. What they lack is the economic power to do so on a wide
scale.

That's been the key point of this discussion. They've been forced
to cling to trailing edge technologies because they haven't had the
economic power to deploy better systems, even though they certainly
know how. They've been able to concentrate their limited economic
power to produce showcase items like their space program and
a few high tech bits of military hardware, but they've been unable
to do so on the mass level needed to let the technologies filter
down to the rank and file.

We've had a couple of ex-Soviet TV staffers working for us for
a few years now. They tell me that even today they are still amazed
when they go to the supermarket or the mall. The level of technology
available to the masses, and the quantity of it, still astounds them.
The level of technology which was restricted to their most advanced
military systems is a commonplace component of children's toys
over here. And that's the difference. Our economy has allowed us
to push high technology to the mass market level, theirs couldn't.

As an illustration of what that means, during the mid-80s, a Soviet
sonobouy was recovered in the Atlantic. When it was disassembled,
it was discovered that the embedded processor it used was from a
batch used to build Mattel toy robots. The Soviets had been buying
the toys, extracting the chips, and using them in their front line
military equipment. That's because they didn't have the fab capacity
to build their own in production volumes.

Any high tech enterprise depends on literally hundreds of other
enterprises to build the tools to build the tools to build the system.
Only a robust economic system can produce that at mass market
cost levels. Without it, you can do one-off showcase stunts, but
you can't field the technology on a large scale. So we have the
contrast of Russian troops being taught Morse Code, no doubt
on vacuum tube equipment, while their counterparts in the
West are being instructed in the use of digital comm systems
using advanced VLSI architectures. Where the two have clashed,
it hasn't been the primitive techniques which have won.

Both war and civil commerce have changed qualitatively since
WWII. The critical difference has been in the timely flow of
information to allow precision targeting of resources, whether
that's in a smart bomb, a air tasking order of a couple hundred
pages, or in just in time manufacturing and distribution inventory
tracking and control. The information flows needed to be competitive
today are orders of magnitude larger than in the WWII era. Morse
can't cut it, digital comms can.

There was a time when ham radio held a mystique that captured young minds. I remember when I came downstairs on Christmas morning of '74 and under the tree was a rig which was old even at that time, but still working well: a Hallicrafters HT-32B transmitter and a National HRO receiver. My dad and I were both interested, and listened a lot, and studied and practiced for the day when we could go on the air. I was licensed at age 12. My dad was at work when the licenses came in the mail, so I got to make the first contact. I still remember the thrill of getting on the air that afternoon. WN8TEE, Micky, age 15. Magic! Through a wire strung up in our front yard, I was communicating! Never mind we could have picked up the phone and called each other.

To someone with genuine appreciation for the radio art, and due respect and consideration for others on the band, it doesn't matter whether a person operates SSB, AM, CW, or something else. It just so happens that there are more of these considerate, respectful types on CW.

For Sale: Crown International PSA-2X Professional Self-Anaylzing Stereo/Mono Amplifier...This Amplifier is a cream puff, Mint Condition, I'm the original owner, Have Manual and original Carton. It's a very Powerfull Amplifier, Rated as follows: 275 Watts RMS Per Channel into 8 ohms...460 Watts RMS Per Channel into 4 Ohms...700 Watts RMS Per Channel into 2 ohms...I also have the Optional Balanced Input Module Installed, Which allows you to feed the Amplifier with a preamp or mixer having a Balanced Output Signal, if Desired. It also has a built in Cooling Fan..But it runs cool even at power levels that would fill an auditorium. I really would rather keep it...but 2 years ago I moved back to the basement apartment of my parents and have no room for any stereo equipment...I've already sold the whole system...only piece left is the Crown Amplifier...If you are Familiar with Crown International, you will know that for the last 50 years they have been known for Extremly High Reliability, and excellent Quality.
I paid $2300 for the Amplifier complete w/ the Optional Balanced Input Module...I'm asking $1200 Firm...If your serious about the Amplifier e-mail me with your e-mail address and or telephone number at cmd-dell@worldnet.att.net

Thank You
Carl Domanico

>other.

The magic is gone. Not because of the decreased use of Morse code, but because of the huge advances in technology that have occured since then. Decreased use of CW is a RESULT of this technology. Forty years ago...sure, it was "magic" to be able to send mechanical noises over the airwaves and communicate. These days, we have virtually free worldwide communications of audio, video, text, etc., via the Internet. Some people continue to embrace CW and send messages with a brass key for nostalgic purposes...and that's fine...just as some people choose to keep a 1957 Chevy in their garages for Sunday afternoon drives. But there is no legal justification in this day and age for continuing to require proficiency in Morse code as a condition of obtaining a radio license from the government. It is my belief that the Morse issue will eventually be argued in court on those grounds, and the requirement will then likely be dropped.

Emergency communications are an optional part of amateur radio. Nowhere in the rules does it say that one must participate in emergency communications in order to obtain/retain their license. Furthermore, in this day and age, VERY few emergency messages are still delivered via Morse code. The SHIPS and the MILITARY don't even use it anymore...even if you DID send a message in Morse, who would hear and be able to decipher it?

Rubbish.

> Some [Pro-CWers] say HF amateur bands will become CB band if
>there is no CW requirement for HF bands.

I don't like to state it in those terms because it's pure CB bashing. And I believe CB radio has its place. But a loosening of requirements, any requirements, for licensing will have the effect of allowing more unskilled and uninformed persons on the air. This is not per se a bad thing. In this case, good and bad are judgment calls, it depends on what kind of hobby and radio service you want. Consider this: do you think it would be a better or worse ham radio if all the tests were just replaced by an application to be sent to Washington with a $10 filing fee? Believe it or not, some people agree with you on this and others do not. It depends on what kind of hobby you want radio to be. For many of us, a ham radio license is an earned reward for study and practice. And isn't a prerequisite for getting into the hobby.

>10 years ago before no-code license was created, many said the same
>thing. "VHF bands would be flooded and would become worse than CB
>radio" It didn't happen.

Yes. And what else didn't happen? Hordes of techies who couldn't or wouldn't get up to dead-slow 5wpm code but were otherwise the most brilliant minds in the world were supposed to come running to ham radio and save the hobby. Listening to the extremists on either side is perhaps mildly amusing but basically a waste.

>Umm... do the amateurs who do not go
>through the CW elimination will be same as CBers...
>Listen to 2m and 440. It's much clean compared to some HF bands
>where you can listen to those CW foggies who breaks the law and makes
>the bad representation of ham community.

Cleaner from a language usage standpoint but dirtier from a standpoint of being populated by unskilled and uninformed people. This effect isn't fully realized yet, of course, because there are so many knowledgeable people on VHF that conversations tend toward science. But it is definitely changing. And when you make the comparison with HFers, don't let a few lids on 75m represent the whole of HFers. You must listen to 160, 17m, 15m, 30m, all the HF bands to make the overall representation.

Oh, by the way, the "foggies" as you so call them who use bad language on SSB are NOT USING CW! They practiced enough to get an HF license and dropped it for the less respectful mode of SSB. This should

tell you something. Maybe not.

> If CW is fun, why less than 0.01% of whole population in the
>world know the CW ?

I don't know how to ski, but I'll bet it's fun. Some people just
don't take the time. Besides, being fun or not-fun is a judgment
call. I know people who have learned and practiced the code
just as a means of getting on HF, or on the air, then forgot about
it because they don't find it fun.

It is useless arguing about something that's purely in the mind
of the beholder because there's no accounting for taste.

> It may be fun, but it is not fun of the majority.

You really judge what's fun by majority vote? That's weird. Do
all the things you like to do have to be enjoyable by a majority
of people? That's downright strange.

Better go check 30m for openings. See ya.

cute@radiotelephone.net.ham (Cutie Boy) wrote:

>CW:

>Also some say you can communicate who doesn't know English (or simply
>between different languages) very well. This is a false statement.

Not on its face. It depends on what you call communication. For some,
even on voice modes, all that is desired is name, location, and signal
report. CW abbreviations make this very possible even without a common
language. If you want to have a "real life conversation," you'll need to find
a common language. But that's also necessary in voice. So CW allows
limited communication without a common language while voice alone allows
none. So it's capability, although limited.

>... If you have no idea what " J'ai 18 ans. " (if
>someone transmits in CW) means, you are deadend !!

I think even our President knows this statement, in all languages! :-)

>Some additional comments about CW:

> - Too slow (1/1000000 of internet or digital signal ?????)

Too slow again is a judgment call and depends on what you are looking
for. I run about 27 wpm usually. And without repetition that's fast enough
for me to chat. You'd be surprised at the conversations you can have at
that speed. I've discussed antenna designs, modulation techniques, and
just yesterday the acquisitions by Boeing and Compaq.

> - Obselete, Outdated

Well this one has yet to be proven. The human voice is an older mode
of communication than Morse, and voice is not obsolete yet.

> - CQ CQ CQ only. No real life conversation

CQ is only a method of making contact. You never heard a CQ in voice?
You must hang out on 20m. Real life conversation is what comes after
the initial call.

> - Not many people in the world know it.

Listen on 30m or the bottom end of 20m sometime. This statement is
definitely untrue.

The following is an excerpt from an article in Ham Radio Online. http://www.hamradio-online.com/1998/jan/rebecca.html Rebecca Rich (KB0VVT) became interested in amateur radio while her mother, Barbara (KG0UT), was studying for her licenses. I developed a software application using Visual Basic for Windows to use for studying the amateur radio theory. There are many good computer programs available to assist amateur radio study. Rebecca would pretend that she was studying like her mom. She was seven when she earned the Technician Class License on March 23, 1996. Six months later, on September 28, 1996, she earned the Advanced Class License. Now, the pressure was on mom and dad to join their daughter in studying for their Extra Class licenses. I hope the readers find the following information useful and inspiring. The tips presented can be used for any class license one seeks.

If an 8 YEAR OLD can learn that much code, anyone should be able to do it. Read the rest of the article. I think you'll find it VERY interesting.

That maximizes communications utility while minimizing the impact
on other spectral users. That is generally considered a good combination
of properties in a communications system.

I'm looking for information on a VERY low power FM Broadcast transmitter. I'm trying to find something that I can hook up to the 2M rig in my shack and broadcast to all of the FM receivers in my house. I've tried 2 or 3 different commercially available transmitters and they all stink. They can barely transmit across the room. Does anyone know
1) What the max output power is that is allowed?
2) Any place to order such an item?

Thanks

Stan

Huh? Duh? Wha? Hello, wake up call for Mr. Masa, anybody home? You post study guides and exam information on your web site and claim the information is taken from Government Publications. The above comes from a document you call

"Amateur Radio and Professional Radio Certificate Exam Information"

Cutieboy wrote:
>I am taking the info directly from the exams. If my study guide is
>wrong, then the exams are wrong. Well... too bad.

Here are some other favorites from the same document under the heading "Amateur Radio Certificates"

"The basic concept of the amateur radio is the same as CB radio (walkie-talkie)."
<- My personal favorite
"The people can keep in touch with or just talk with others by using two-way radios"
"You can talk with anyone in the world, but some countries forbid the amateur radio communications (ie. Zaire, Iraq).
You do not want to interfere other countries' jurisdictions."

The above are all very amusing but the winner by a quarter length goes to :

"The government (nationally and internationally) and we, the amateur community would like to see your knowledge so that we all can enjoy amateur radio communications"

Well done Masa, I can see how you pay close attention to detail and your clearly focused on publishing a well written and accurate document. Perhaps you can use these documents as testimonials to your professionalism when you graduate and begin looking for employment.

You're looking for a Ramsey transmitter. They make several different models...the 10A, 25A, and other "export" models with power levels as high as 10 watts. Of course, these are not legal for use in the U.S., although there seem to be quite a few in use :-) Low-end pirate broadcasters tend to like these.

Bottom line: the "legal" FM transmitters are basically nothing more than "Mr. Microphone" type toys. They have less power than the 49Mhz toy walkie-talkies. If you want something that works, you'll have to go the other route. The Ramsey equipment does work quite well, by the way. Plenty of signal and good, clean, stereo audio if installed and operated correctly.

Once again, whether someone "can" or cannot" learn something has nothing to do with whether a requirement is relevent and necessary for the purposes of obtaining a government license to perform the activity.

I "could" pass the test for a motorcycle endorsement on my drivers license, too...but there is no reason nor requirement for me to do so, since I have no intention of operating a motorcycle. Get it?

License modifications filed within 90 days of expiration are
automatically renewed for 10 years. Those filed more than 90 days of
expiration are not.

Not many people in the world know the CW (compared to the number of people who knows CW). I will say less than 0.00001% of world population knows CW... thus not many people in the world know it.

Think of the population in the US. How many people know CW ??

3056. Myth #11: There is Driver's License

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-31 00:00:00 UTC
From: cute@radiotelephone.net.ham
Message-ID: <34d35627.7682951@news.total.net>
Source record: 180126
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur

There is Driver's License in most of (? or all ?) North America.

When one takes an exam, the exam does not ask you how the engine works nor how the speed meter works. Instead, you get an exam which is directly related to actual operation of the vehicle... practical.

For the amateur radio, CW takes care of almost everything (for HF bands). Knowing CW has nothing to do with actual operation of the radio... especially those who are looking for making contacts in voice.

The amateur radio should focus more on practical part (ie. how to store the frequency into the memory etc. as many Pro-CWers who I know of don't know.), not CW.

If someone wants to make a contact in CW, go ahead. Don't force it to others.

It's like forcing driver license candidates to know how the engine works. If you want to know how the engine works because it may be useful in your life, go ahead. If you think it must be forced, you must be really strange.

You say CW makes a good ham. You say the knowledge of engine makes a good driver. What a strange statement...

It seems to be the only way you can understand anything, maybe you ought to forget Ham Radio and become a Grammer Teacher, or maybe even a Composer of the English Language since you never have any real comments to make.

>bear frequency oscillator....

so ? what do you want to say ? the exam asks you the question
and if you say you don't know the bear frequency oscillator so the
choice (of multiple) say incorrect, you don't get the point for this
question.

Because most of the study guide is not based on the government exams,
no reason why many people fail the exam.

>"-The receiver can pick up more signals (weak strength) = less noises"

>intermediate frequency (or IF) is 7 MHz"

>Man, I can't hear "anything", should I tune to "something" or just tune to "anything"
>and try to hear "something"?

If you don't know how to tune to the image, ignore it. You don't
know anything about the radio.

>"Connecting these meters will act in circuit as... low value resistance"

ammeter or voltmter or it doesn't matter. ask the professional for
the details. the question asks the similar thing on the exam (low
value resistance as a choice). If you don't know you don't get
any marks !!!!!

Since many study guides out there don't mention about this, many
people don't pass the exam. period.

>What balls you must have to actually ask $20 Canadian
> for this garbage.
^^^^^^^^^^^^

This is an insult. I do not tolerate this.

> Are you
>surprized that you haven't gotten rich yet?

because everything is available for free, why pay for it ??
you must be really stupid if you really think you can get money by
giving away full version of shareware or whatelse.

> Here's a little hint for you Masa, when
>attempting to promote study guides and exam material it is somewhat important that
>the matierial is correct.

material is correct according to the exam.
I will find out the question for you if you wish (from the exam).
If there is such a question that I have on my study guide, what are
you going to do ??
Are you going to apolozise because what I say is correct ? (based on
the exam ?)

> It makes a big difference to the person reading it.

yeah, it doesn't make a big different to the person reading 100s of
pages of study material.

3062. Interference with cable/phone?

Newsgroup: rec.radio.amateur.misc
Date: 1998-01-31 00:00:00 UTC
From: kjpodsia@cyberramp.net
Message-ID: <kjpodsia-3101981125460001@dal-tsa20-51.cyberramp.net>
Source record: 180132

Hello.

I am seeking some help. For the past several months, I've been getting interference on my cable TV in the form of a garbled human voice. This I had tolerated, but recently I have noticed that this interference has also been affecting my phone lines, causing my modem to disconnect frequently when it occurs.

First of all, am I correct in my deduction that this is probably caused by a ham operator? If so, then I need some further help. I am in an apartment complex and while I would like to track down the source, going door-to-door is likely to be too time-consuming. Does anyone know of some sort of instrument (not too expensive, I hope!) which I could use to track down the interference and have the guy knock it off (or readjust his set in some way)?

Thanks in advance for any help; email replies are preferred, though I will try to scan this group.

>If an 8 YEAR OLD can learn that much code, anyone should be able to do it.

Let me appologize for that statement. It seems to be very prejudicial. That was NOT my intent. I realize that there are a number of amateurs out there who have touble learning code. I did not mean to try and put you down at all.

Now, back to the original point. The No-Code camp wants the code requirement dropped as a part of amateur testing. That is all fine and dandy. The problem is that this is not likely to happen any time soon. If it does, GREAT. Then we can all find something else to argue about.

Nope, I said *condition* not train. Conditioned responses are easier
to generate when the subject isn't smart enough to figure out another
response than the one you want. If you've ever dealt with horses and
mules, you know what I mean. The mule is smarter, but it is much
harder to condition him to respond properly to your stimulus. In fact,
he's liable to give you a look which says, "you've got to be kidding"
before he kicks your fool head in.
